## LIFE CYCLE ASSESSMENT

The International EPD® System has adopted an LCA calculations procedure, which is separated into three different life cycle stages:

- **Upstream module (from cradle-to-gate):** Harvesting of cotton, extraction of man-made fibres, production of yarns and production of fabric, extraction and production of the chemicals.
- Core module, manufacturing processes (from gate-to-gate): Transportation of raw materials to the core, manufacturing processes, impacts generated by fuel burned, impacts due to the electricity production and transport with in the production plant.
- Downstream Processes (from gate-to-grave): Transportation from preparation to an average retailer. Use phase and end of life phase are excluded from the system boundary due to the aim of the EPD is to be used as B2B communication. The impacts of the downstream processes are negligible as being lower than 1% in the entire system boundary and not declared separately in the EPD.

## Geographical scope of the EPD

Worldwide

## **Declared Unit**

The declared unit is defined as 1 pair of trousers.

# EPD Type (System Boundry)

Cradle-to-customer

#### **Data Collection**

Specific data (primary data) was used for the Core Module and gathered from the Martelli Manufacturing Plant. The only main material in the end product is fabric and LCA information has been provided by the fabric manufacturer and inserted into Simapro. Data represents the period from 1st January 2019 to 31th August 2019. For secondary data Ecoinvent v3.5 datasets were used. LCA was modelled in SimaPro v9.0.0.31.

## Allocation

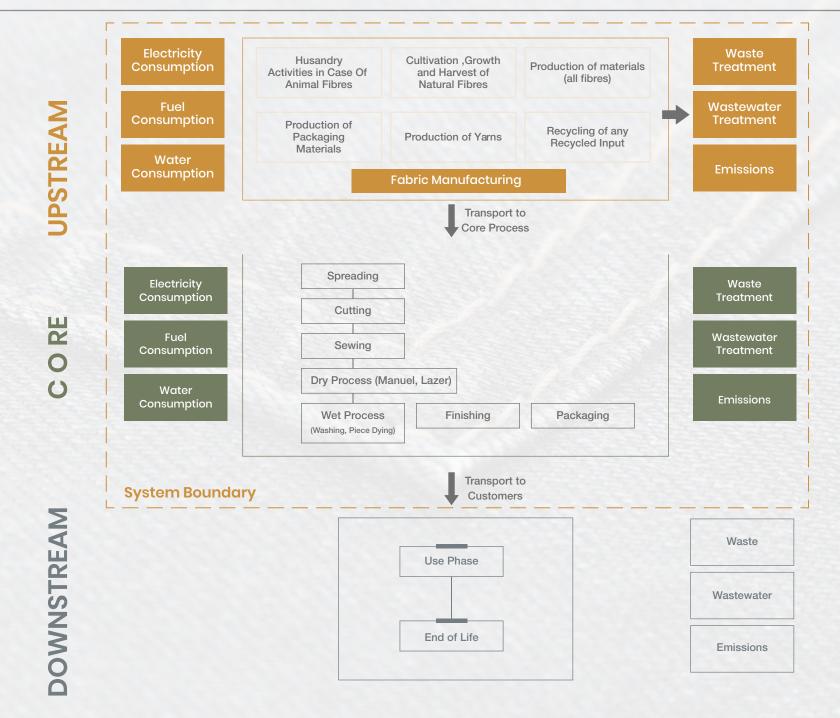

No allocation conducted for input materials and energy consumption was collected specifically per declared unit.

#### **Cut-Off Rules**

Waste and wastewater generated from core presses have been excluded due to the cut-off rule. Impacts caused by treatment operations have been calculated lower than 1% environmental relevance. Transportation to core processes was found negligible <1% for all categories.

## **Calculation Methods**

All resource use values are calculated from Cumulative Energy Demand VI.11 in SimaPro outputs; net use of fresh water from SimaPro Inventory results. Potential environmental impacts are calculated with the CML-IA baseline V 3.05, Acidification potential from CML non-baseline V 3.04, Formation potential of tropospheric ozone (POCP) from LOTOS-EUROS as applied in ReCiPe Midpoint (H) v 1.13 2008, methods in SimaPro software.
