

ENVIRONMENTAL PRODUCT DECLARATION

EOX

EPD Owner	TK Elevator GmbH
Program	The International EPD® System EPD International AB www.environdec.com
EPD registration number	S-P-08258
Published	2023-04-12
Version date	2023-12-14
Valid until	2028-04-11

An EPD should provide current information and may be updated if conditions change. The stated validity is therefore subject to the continued registration and publication at www.environdec.com

Measuring the environmental performance of our products is the foundation for continuous improvement.

Verification

CEN standard EN 15804 serves as core PCR	
Independent verification of the declaration and data, according to EN ISO 14025:2010	
<input type="checkbox"/> Internal	Covering: <input type="checkbox"/> EPD process certification
<input checked="" type="checkbox"/> External	<input checked="" type="checkbox"/> EPD verification
Procedure for follow-up during EPD validity involves third party verifier: <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No	
Third party verifier: Rubén Carnerero Acosta (individual verifier) Approved by the International EPD® System Contact: r.carnerero@ik-ingenieria.com	

The EPD owner has the sole ownership, liability, and responsibility for the EPD. EPDs within the same product category but registered in different EPD programmes, or not compliant with EN 15804, may not be comparable. For two EPDs to be comparable, they must be based on the same PCR (including the same version number) or be based on fully-aligned PCRs or versions of PCRs; cover products with identical functions, technical performances and use (e.g. identical declared/functional units); have equivalent system boundaries and descriptions of data; apply equivalent data quality requirements, methods of data collection, and allocation methods; apply identical cut-off rules and impact assessment methods (including the same version of characterisation factors); have equivalent content declarations; and be valid at the time of comparison. For further information about comparability, see EN 15804 and ISO 14025.

About this EPD

At TK Elevator, we have a strong sense of responsibility towards our customers, employees, society and the environment. Our aim is always to develop solutions that go far beyond the industry standards in all these areas.

Within the context of sustainability, we want to understand the environmental performance of our products. That is why we develop Life Cycle Assessments (LCAs) to identify relevant fields of action and enhance the design process.

Our goal is to minimize the environmental impact of our products. To communicate the results of LCAs to the public and ensure transparency regarding the environmental impact of our products, we publish EPDs.

The benefit for our customers is solutions that fulfil the highest demands in terms of efficiency and product responsibility. In addition, they can use EPDs in the context of their green building certifications and introduce elevators into the life cycle assessment of their buildings.

What is an EPD®?

An EPD provides information about the environmental performance of a product. In the case of this publication, the results refer to TKE EOX elevators.

Development of this EPD

Both the EPD and the underlying LCA study have been developed and third-party-verified in accordance with the product category rules (c-PCR) for elevators within the framework of the International EPD® system and its general program instructions for type III environmental declarations according to ISO 14025.

Furthermore, development and verification also follow ISO 14040/44 and the calculation of the energy demand is carried out in accordance with ISO 25745-2. The characterization methodologies used to calculate impact categories on midpoint level are those recommended by EC-JRC, as requested by the PCRs.

Data collection

The data used in the present study is a combination of measured, calculated and estimated data. The main data sources are the internal data of TK Elevator, generic databases such as GaBi and data from Tier 1 suppliers.

Cut-off criteria

Cut-off criteria were applied in accordance with the PCR and EN 15804. The evaluation was comprehensive, covering all mandatory inflows and outflows while also considering the quality and

Key terms

Environmental product declaration (EPD)

according to ISO 14025: Type III environmental declarations provide quantified environmental data using predetermined parameters.

Life-cycle assessment (LCA) according to ISO 14040: "Compilation and evaluation of the inputs, outputs and the potential environmental impact of a product system throughout its life cycle."

Product category rules (PCR) according to ISO 14025: "A set of specific rules, requirements and guidelines for developing Type III environmental declarations."

Functional unit (FU) according to ISO 14040: "The quantified performance of a product system for use as a reference unit."

completeness of data. For information module [A1-Raw material supply] the amount of input materials corresponds to 100% of the reference unit weight. Production, maintenance and disposal of manufacturing infrastructure, indirect activities, business travel and all other non-mandatory processes were not included in the analysis.

Description of functional unit (FU)

According to the PCRs for elevators, the functional unit is defined as "transportation of a load over a distance, expressed in ton [t] over a kilometer [km] travelled, i.e. ton-kilometer [tkm]."

Comparability of results

Comparability between EPDs based on this c-PCR-008 (to PCR 2019:14) and EPDs based on PCR 2015:05 is not conceivable and shall be avoided. Any comparability of this kind shall be considered as false and misleading the EPD user.

Comparability between EPDs based on this c-PCR-008 (to PCR 2019:14) is only achievable, if the following performance characteristics are equivalent: Functional unit, Reference Service Lifetime, Usage Category, travel height, number of stops, rated load, rated speed and geographic region.

About us

Móstoles

TK Elevator serves customers in over 100 countries and employs more than 50,000 people across approximately 1,000 locations.

Our customers are around the world, and our manufacturing footprint reflects this reality, extending from North and South America to Europe and the Far East. At each of these locations, we concentrate our expertise and experience on engineering and manufacturing urban mobility solutions, developing innovations and continuously optimising existing products.

As a part of this network, our plant in Móstoles, Spain, produces EOX elevators to the highest quality standards customers expect from TK Elevator.

Committed to excellence

We are also committed to achieving the highest standards in all our processes and operations with regard to health, safety, environmental protection and the responsible use of energy and resources. For this reason, all our operations are certified in accordance with the following international standards:

- Lift Directive 214/33/EU, Annex VI, Module E: Quality Assurance for Safety Components
- Lift Directive 214/33/EU, Annex XI, Module H1: Full Quality Assurance for Lifts
- DIN EN ISO 9001: Quality Management System
- DIN EN ISO 14001: Environmental Management System
- DIN EN ISO 50001: Energy Management Systems
- ISO 45001: Occupational Health and Safety Management System

THE EOX ELEVATOR SYSTEM

The EOX elevator system

EOX is TK Elevator's new efficient and natively digital elevator platform. EOX is a future-proof fusion of both the latest energy-saving and digital technologies in vertical mobility.

It spells out TK Elevator's commitment to add value to your buildings: By contributing to energy efficiency [E] and the improvement of the environmental performance. By putting our customers at the centre and going full circle [O] on today's and tomorrow's needs of everyone who designs, constructs, manages or uses a building. And by digitally transforming [X] the everyday elevator.

Naturally green

EOX proves that efficiency and technology can go hand in hand. With its standard included LED lighting for shaft, cabin and landing devices, regenerative drive, stand-by and sleep mode, as well as its innovative mode it actively saves energy in your buildings.

A dashboard in the customer portal provides customers with complete transparency about the elevator's energy consumption and savings on a daily, monthly and yearly basis. And thanks to clever engineering, our 100% renewable electricity European factories and digitally augmented services, fewer CO₂ emissions are produced because of it.

Natively digital

Powered by cloud infrastructure from **Microsoft** as well as high-performance accelerated computing from **NVIDIA**, EOX has the built-in capability to evolve with customer needs. All the components needed for digital expansion are already included from day one, minimizing on-site visits required for future enhancements. Meanwhile, passengers can already connect to EOX with their mobile device to call on the next available cabin, enjoy dynamic content on an in-built multimedia screen in the cabin, and benefit from improved uptime as a result of smart maintenance features.

Improvements

The low-energy design of EOX elevators means that they consume up to 28% less energy than previous products and qualifies them for the highest energy efficiency rating, namely Class A as defined by ISO 25745-2.

At the same time, based on the reference configuration specified in table 1, the material resources needed to produce the elevator have been reduced by more than 10% in comparison with previous products, achieving over 15% reduction in the carbon footprint associated to the use of materials.

The EOX elevator series complies with all relevant international standards and regulations:

- Lifts Directive 2014/33/EU: Directive of the European Parliament
- EN 81: Safety rules for the construction and installation of lifts
 - Part 20: Passenger and goods/passenger lifts
 - Part 50: Design rules, calculations, examinations and tests of lift components
- Type-tested system: certification by notified body
- CE marking in compliance with EU legal requirements to guarantee health, safety and environmental protection
- ISO 25745-1/2

The EOX elevator system

Table 1: Specification of assessed elevator according to the PCRs

EOX		
Index	Representative values for the reference unit	Application range of the elevator model
Type of installation	New installation	
Commercial name (type)	EOX	
Main purpose	Transport of passengers	
Type of elevator	Electric, without machine room (MRL)	
Type of drive system	Gearless traction drive	
Rated load [Q]	630kg	450 up to 1600kg
Rated speed	1 m/s	1 m/s up to 1.75 m/s
Number of stops	5	Up to 20
Travelled height	12,25 m	Up to 75 m
Number of operating days per year	365	
Applied usage category (UC) according to ISO 25745-2	1, 2 & 3	
Designed reference service life (RSL)	25 years	
Geographic region of installation	Europe	
Optional equipment	None	

Table 2: Transportation performance for selected usage categories according to the PCRs

	UC1	UC2	UC3
FU (tkm)	129.40	323.50	776.40

Representative installation

The reference for the underlying life-cycle assessment (LCA) study is an elevator to be installed in a low rise residential building in Europe. Its configuration corresponds to the typical application range of the EOX series. For energy consumption during operation, the European average grid mix was considered.

Value and relevance of functional unit (FU)

The FU is determined by the physical characteristics of the assessed elevator (e.g. rated load, rated speed, travelled height) and parameters that are chosen based on its assumed use (e.g. use category, trips per day, operating days per year). The usage categories included in the analysis reflect the use of this product in low rise residential buildings.

Content declaration

A detailed composition of the reference elevator and packaging in quantitative terms according to the PCRs is set out in Figure 1. This content declaration considers all life-cycle phases and cut-off rules according to the PCRs.

Almost 60% of the material the elevator is made of belongs to the material category of ferrous metals, followed by inorganic materials with more than 33%, plastics and rubbers (1,89%), organic materials (1,08%) and non-ferrous metals (1,03%). The rest of the material categories account each for less than 1%.

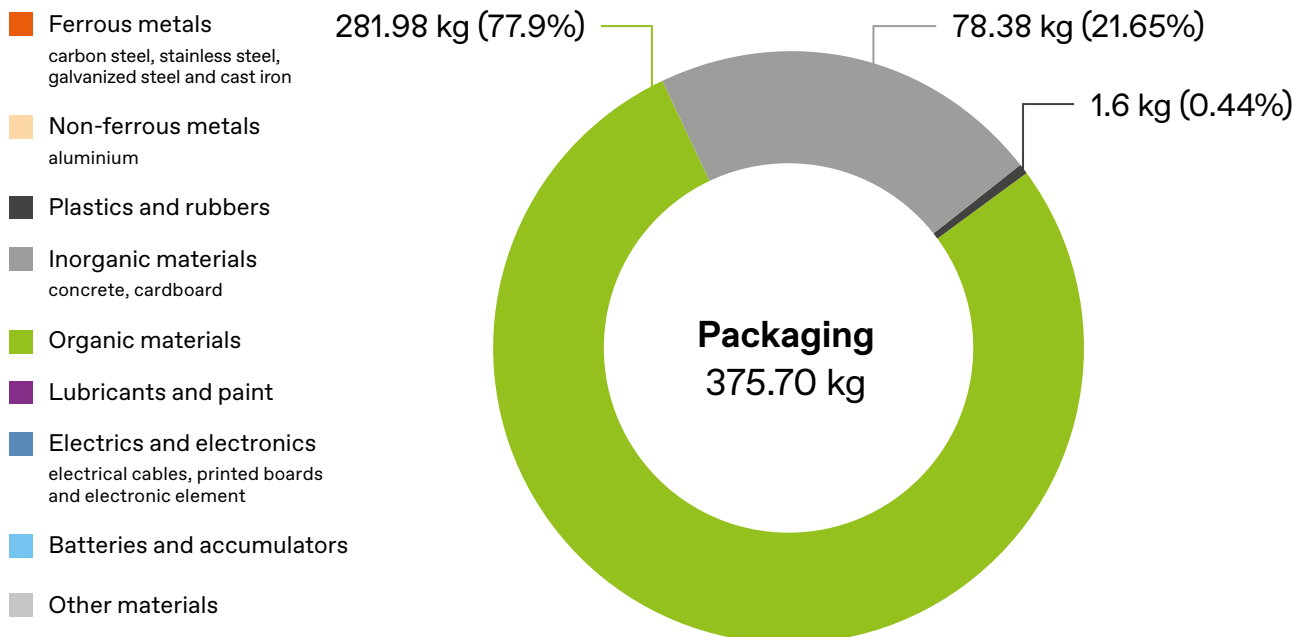

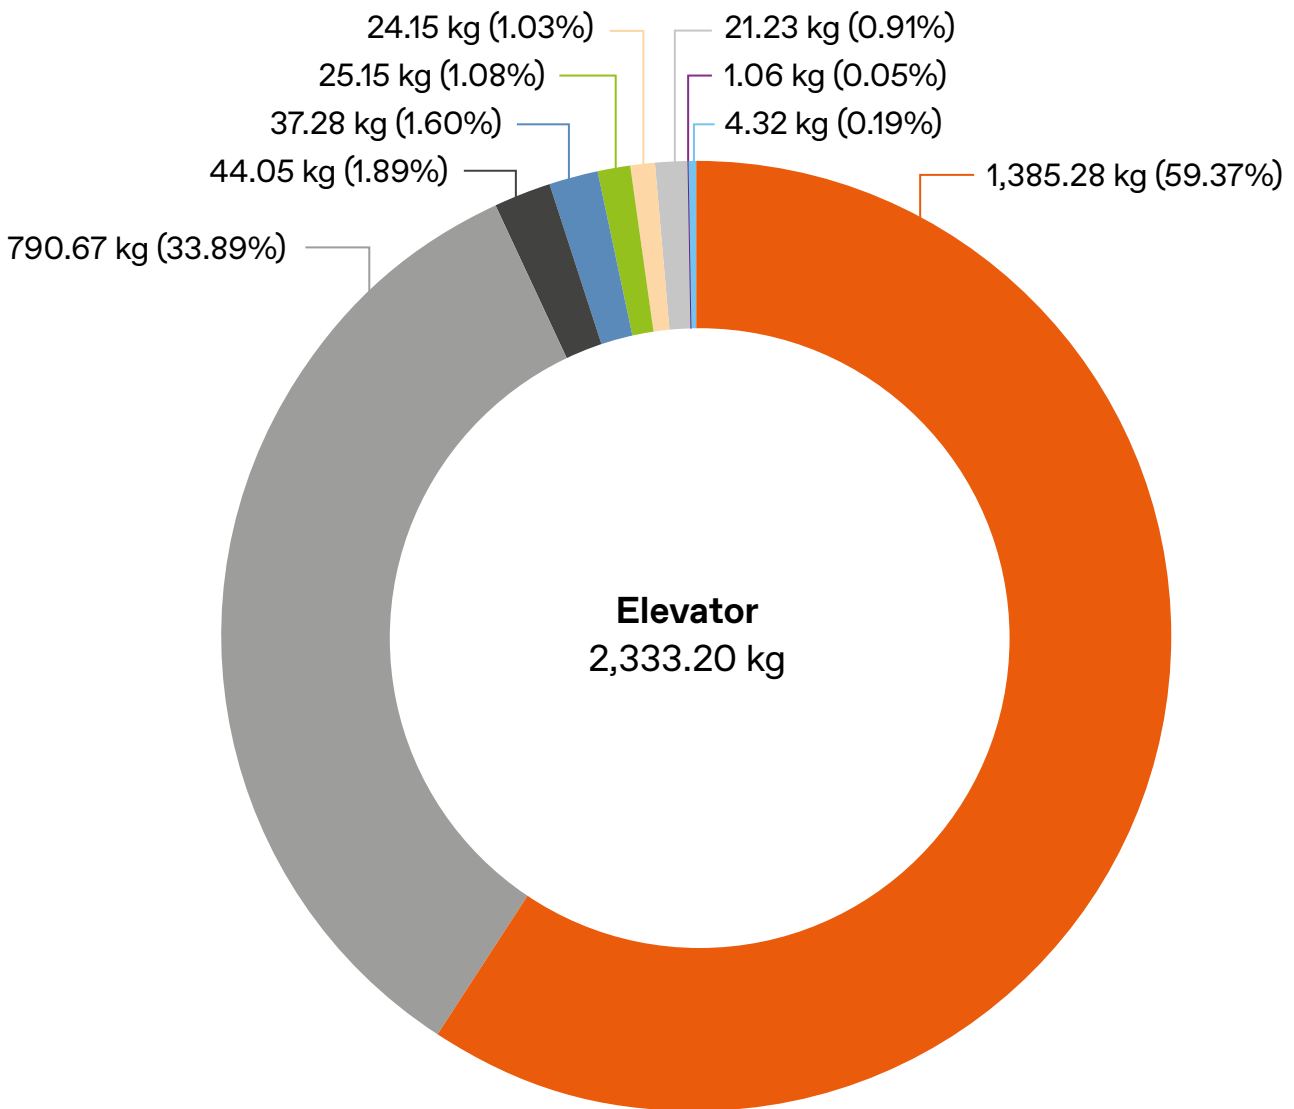

The product-specific content of recycled materials is undetermined. Generic percentages taken from Gabi databases are used for calculations

The subsystems in which these materials are included are mostly Counterweight, Guiderrails, Car, Doors, Traction machine, Controller and Inverter.

Substances in the SVHC list according to REACH directive are avoided as far as possible. Nevertheless, lead (CAS number 7439-92-1) and Octamethylcyclotetrasiloxane (D4) (CAS number 556-67-2) may be present above 0.1 % in weight in some articles used in the product.

The main materials used for the packaging of the elevator are wood and cardboard, that represent 99% of the overall packaging weight, and contain 165.8 kg C of biogenic carbon.

Figure 1: Material balance of assessed elevator (excl. spare parts)

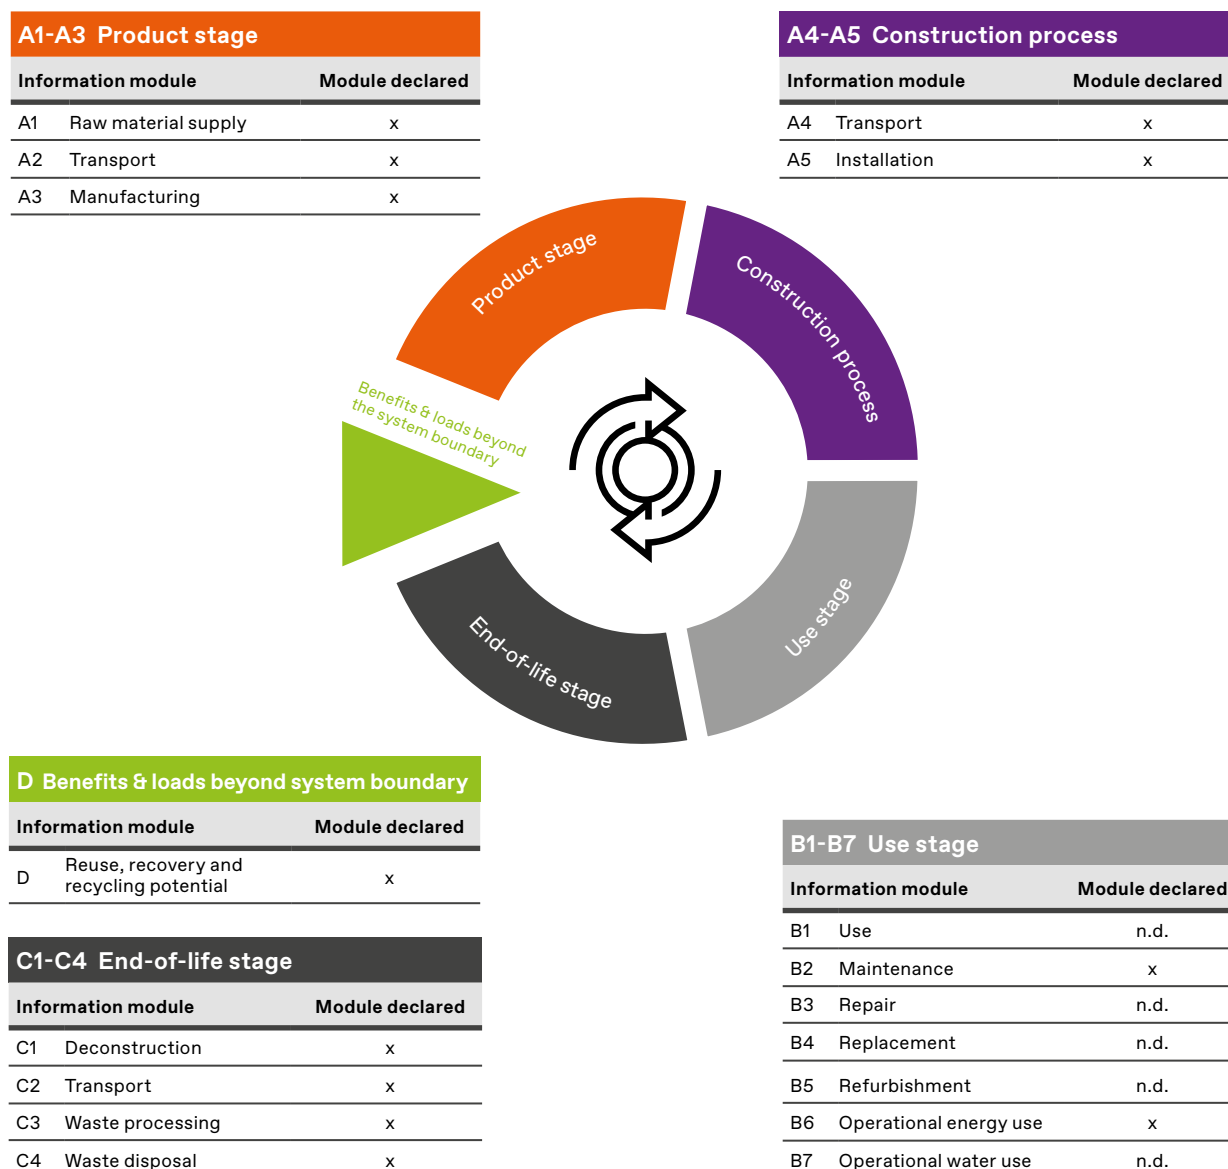

- Ferrous metals
carbon steel, stainless steel,
galvanized steel and cast iron
- Non-ferrous metals
aluminium
- Plastics and rubbers
- Inorganic materials
concrete, cardboard
- Organic materials
- Lubricants and paint
- Electrics and electronics
electrical cables, printed boards
and electronic element
- Batteries and accumulators
- Other materials

Life cycle assessment

According to the applicable PCRs, this EPD has a cradle to grave scope plus module D. Therefore, it covers four main stages. The product stage (A1-A3) aggregates all processes related to the obtention of raw materials and their further transformation and processing to produce, assemble and pack all components for the assessed unit. Manufacturing activities take place at TKE site in Spain and suppliers' facilities located in Spain, Germany, Switzerland and China. The construction process stage (A4-A5) considers the road and sea transport from TKE to the installation site (in Europe), the final assembly of the elevator, and the disposal of packaging. For product and construction stages, the percentage of specific data used is higher than 90%. The use stage (B1-B7) consists of all processes related to operation and preventive maintenance, mainly transport of workers to maintenance site, production of spare parts, energy and auxiliary materials used for maintenance and operational energy use. The end-of-life stage (C1-C4) considers all processes that take place at the end of the elevator service life, this is, the final disassembly, waste processing, and disposal of the elevator components and materials. Finally, module D includes the benefits derived from the recycling of metallic materials and energy recovery from the incineration of packaging materials. The geographical scope for all downstream processes is Europe. The resulting system boundaries are presented in the figure below:

Figure 2: Elevator life cycle stages and respective information modules according to the PCRs

Results of the study

The following section contains the results of the underlying LCA study according to the PCRs. The disclosure of results is structured in three subsections: Potential environmental impacts, use of resources, waste categories and output flows. The tables show results per FU for the three analyzed UCs.

ADP impact categories (see template):

* Disclaimer: The results of this environmental impact indicator shall be used with care as the uncertainties of these results are high or as there is limited experience with the indicator.

Potential environmental impact

* GWP-100: IPCC AR5 GWP, excluded biogenic carbon. See glossary for acronyms.

Impact category results by life cycle stage per FU

The figure below shows the share of the different life-cycle stages for the most relevant impact categories in percentages, resulting in a sum of 100%. It is based in UC2.

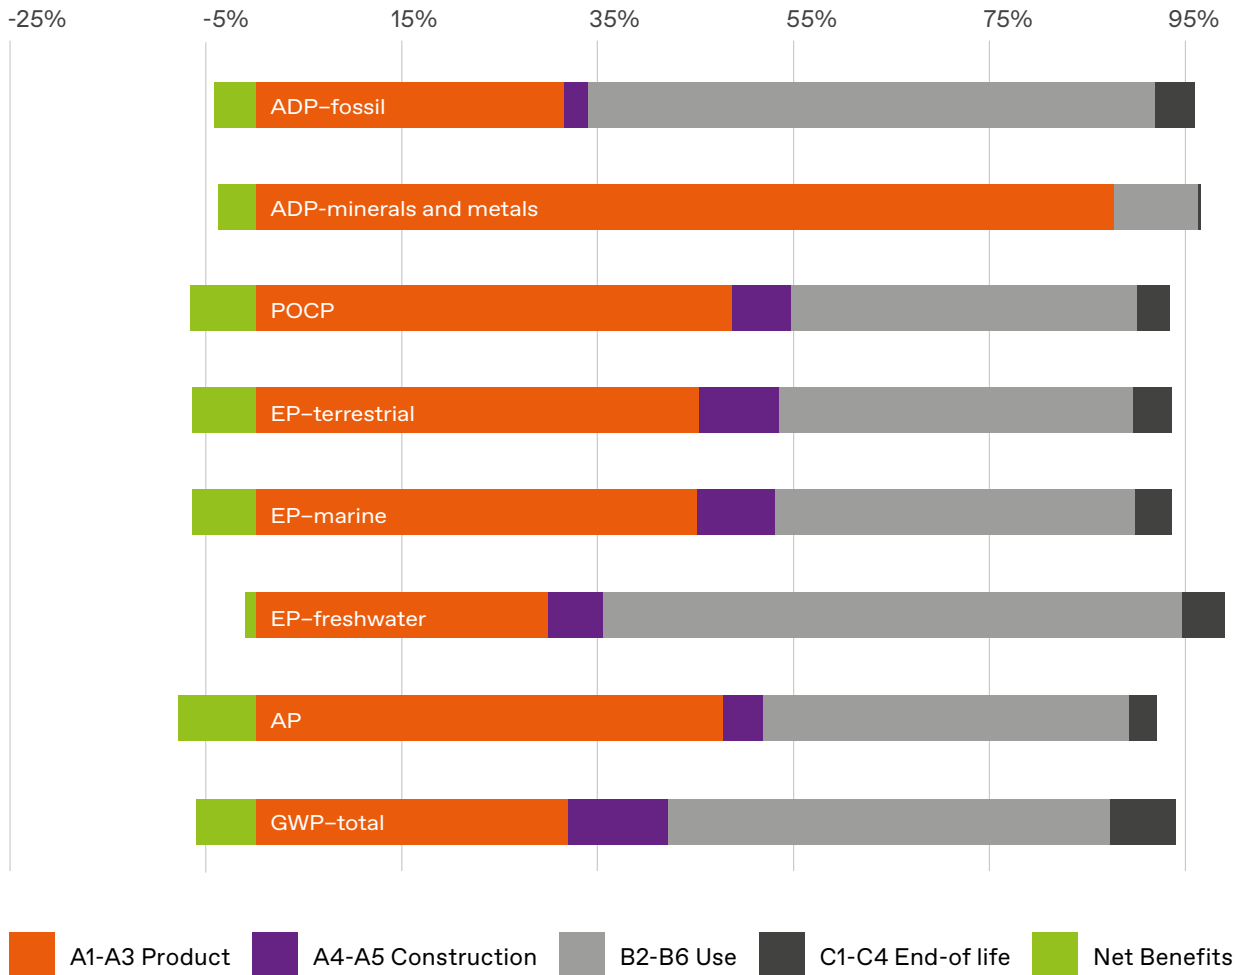

Figure 1: Impact category results by life-cycle stage (in %, UC2)

In the figure below, the impact results of the three largest contributors (B6, A1, and B2) to the overall UC2 results are compared with each other and the sum of the rest of the information modules.

Figure 2: Comparison of impacts of main contributors

ADP-fossil

Use of resources

At this point the results for the use of resources are presented. These are divided into renewable and non-renewable energy resources, including primary energy and energy resources used as raw materials, secondary materials and fuels, and water.

Table 4: Indicators describing resource use by information module

PERE

Use of renewable primary energy excluding renewable energy resources used as raw material

PERM

Use of renewable primary energy resources used as raw material

PERT

Total use of renewable primary energy resources (primary energy and primary energy resources used as raw material)

PENRE

Use of non-renewable primary energy excluding non-renewable energy resources used as raw material

PENRM

Use of non-renewable primary energy resources used as raw material

PENRT

Total use of non-renewable primary energy resources (primary energy and primary energy resources used as raw material)

SM

Use of secondary material

RSF

Use of renewable secondary fuels

NRSF

Use of non-renewable secondary fuels

FW

Net use of fresh water

Waste categories and output flows

The table below provides information about the amount of disposed waste by information module per tkm, according to the categories established in the reference PCRs.

Indicator	HWD	NHWD	RWD

Table 5: Waste indicators by information module

HWD Hazardous waste disposed

NHWD Non hazardous waste disposed

RWD Radioactive waste disposed

The amounts of materials leaving the system boundary after reaching the end-of-waste state are reported in table below. Most part of the elevator materials are metals, with high recyclability. Organic materials used in packaging are considered to be directed to incineration.

Analysis of results / conclusion

General observations

The usage stage is the most important contributor to the overall burden of the assessed elevator over its entire life cycle in six out of twelve analyzed categories (GWP-biogenic excluded). The product stage represents the second highest impact area, being the largest contributor to the remaining five categories. Module [D] results in benefits for almost all impact categories. In contrast, the construction and end-of-life stage have little relevance in terms of the environmental burden.

[B6] Operational energy use

This information module is the one with the highest contribution to the overall environmental burden of the assessed elevator for ODP, EP-freshwater, ADP- Fossil, GWP- fossil, WDP, GWP -total, EP-marine and EP-terrestrial. It is the second most important contributor to AP and POCP. As a result, operation during the use phase also significantly influences overall environmental impact due to the consumed energy. Analysis of alternative use scenarios, in which the assessed elevator is operated in different locations, showed substantial differences in the overall results for most impact categories (GWP-total, GWP -fossil, AP, EP- terrestrial, EP- marine, POCP and WDP). These differences can be attributed to the variations between energy sources for different grid mixes. As a consequence, the choice of grid mix needs to be carefully considered.

Product stage [A1] – Raw material supply

This information module is the information module with the highest contribution to the overall environmental burden of the assessed elevator in categories AP, POCP, ADP -minerals and metals and the second most important one in GWP (-total and -fossil), EP (-marine, -fresh water and -terrestrial), WDP and ADP-Fossil. Its high impact is mainly caused by the energy-intensive extraction and production processes of raw materials used for the different components of the elevator. The

high level of the results is primarily produced by components made from carbon steel and other „Ferrous metals“, which represent close to 60 % of the total weight of the assessed elevator.

Nevertheless, in relative terms components with a high share of Electric and Electronics (based on their specific impact per kg) have the highest impact on the results and are therefore of major relevance in the product life cycle.

[B2] Maintenance

This information module is the second most important contributor in terms of relative contribution for categories ODP and for category ADP -minerals and metals, causing up to 20.8% of its burden. Moreover, it is the third one for categories GWP-total, GWP-fossil, EP-freshwater, ADP-fossil and WDP. For these categories, the production of spare components for the elevator for the whole service life is the most significant aspect of module [B2]. The same as for [A1], ferrous metals and electric and electronic equipment (see table 9) are the main contributors to this burden.

Potential for improvements

The use of ferrous metals, especially carbon steel, has a major effect on the [A1] and [B2] impacts. In context of Rails, Fishplate & Mounting Material, Car, Doors and Machine, components with optimized geometries could be developed in order to provide a weight reduction and therefore lower impacts. With reference to the ferrous metals, components made of organics, plastics and rubbers show lower impacts than of ferrous metals due to a major weight reduction. As a result, using these materials as an alternative – if feasible for their application – may achieve improved results. In addition, in terms of moving parts, the lower weight results in less energy demand and thus optimises B6 values.

Scenarios and additional technical information

Allocations in [A3]

Resource usage and waste corresponding to EOX elevator production cannot be accurately determined. Overall annual facility figures and elevator units produced are used to allocate inputs and outputs for the assessed elevator. Suppliers' data is allocated based on the weight of primary products delivered to TKEMS for elevator assembly.

The in-house manufacturing process involves cutting, bending and press-joining metal sheets to produce final components for the elevator, including the frame counterweight, platform, ceiling cabin, tension pulley, cabin structure, and decoration. Other components, such as the car and safeties, are manufactured and assembled at TKEMS factory using primary products from suppliers, such as handrails, flooring, lighting, and cabin apron.

Electricity grid mix in manufacturing [A3] and operation [B6]

The EOX elevator is produced at TKEMS site in Spain, which is operated using 100% renewable electricity, with elevator components and materials coming from suppliers located in Europe (mainly Spain and Germany) and China. Therefore, representative electricity grid mixes for Germany, Spain, China and European average have been taken for [A3]. For the operational energy use, the average European grid mix is considered. The table 7 reflects their environmental impact expressed in kg CO₂-eq/* kWh.

Table 7 Information on electricity grid mixes

Country	CO ₂ -eq/kWh
Germany	0.512
Spain	0.359
China	0.811
Europe (average)	0.372
Europe (average) Electricity from wind power	0.0106

Transport to installation site [A4]

Road and sea transport is used to deliver low rise elevators to European and African destinations. Average distances have been calculated taking into account the countries where this elevator is most frequently installed. The table 8 below summarizes A4 data.

Table 8: Data in context of transport to installation site summarizes A4 data

Type of vehicle	Distance	Capacity utilisation	Bulk density
Truck-trailer, Euro 4, 34 - 40t gross weight / 27t payload capacity	1367 km	61%	156kg/m ³
Container ship, 5,000 to 200,000 dwt payload capacity, ocean going	352.9 km	70%	156kg/m ³

Installation in the building [A5]

This module includes all inputs and outputs related to the installation of the elevator at the building site, as well as the treatment of the waste generated by the packaging used for the transportation.

Table 9: Installation of the product in the building

Data	Value	Unit
Electricity Consumption by Installation Tools	273.9	kWh
Carbon steel (welding electrodes, anchorage)	2.68	kg
Transport distance for auxiliary materials	32	km
Transportation Distance to Disposal Site (packaging materials)	25.7	km
Waste materials (spare parts)	211.35	Kg
Waste materials (packaging)	34.68	Kg

Maintenance [B2]

Preventive maintenance activities are scheduled activities, which ensure the proper operation of the elevator during its reference service life. The main inputs in this module are the transport of workers to the installation site, the electricity consumption during maintenance activities and the raw material extraction for spare parts. The tables 9 and 10 summarize these inputs.

Table 10: Data in context of preventive maintenance

Data	Value	Unit
Maintenance cycle and process	As in maintenance manual	
Maintenance cycle	9,3 as a EU average	Visit per year
Annual electricity consumption by maintenance tools	19.852	kWh
Annual oil consumption	1	kg
Annual wax consumption	0	l
Transportation Distance to Disposal Site (packaging materials)	25.7	km
Annual diesel consumption for transport of workers	1.68	l

Table 11: Material content. Spare parts

Material type	Weight in kg	Share of total in %
Ferrous metals	122.26	57.9%
Plastics & Rubbers	57.09	27.1%
Inorganic materials	15.53	7.4%
Non-ferrous metals	13.74	6.5%
Other materials	2.00	0.9%
Organic materials	0.36	0.2%
Overall	211.42	100

Energy consumption in operation [B6]

The EOX elevator annual energy consumption during operation has been calculated acc. to ISO 25745-2. For this study Usage categories 1, 2 and 3 of ISO 25745-2 have been considered (between 50 and 300 trips per day) as they represent the most typical applications for this reference unit in low rise residential buildings. The annual energy consumptions are those indicated in table 11.

Table 12: Calculated annual energy consumption

Usage category (acc to ISO 25745-2)	Calculated annual energy consumption [kWh]
1	410.91
2	520.29
3	737.42

End-of-life [C2-C4]

The elevator is mainly composed by metallic materials, with high recyclability and high recycling ratios in European countries. Plastics are considered to be disposed at waste incineration facilities, and the rest of materials are considered as landfilled.

Net benefits in module D are calculated based on the metals directed to recovery using a net flow calculation acc. to EN15804, taking into account the input and outflows of recycled materials.

Table 13: Information about end-of-life processes

Processes	Unit	Amount kg/kg
Collection process	Kg collected separately	1
	Kg collected with mixed construction waste	0
Recovery system	kg for reuse	0
	kg for recycling	0.60
	Kg for energy recovery	0.18
Disposal	Kg for final deposition	0.22

Glossary

Glossary				
Impact category	Abbreviation	Unit	Characterisation method	Description
Global Warming Potential (100 years)	GWP-total	kg CO ₂ -eq.	Baseline model of 100 years of the IPCC based on IPCC2013	The global warming potential (GWP) is a relative measure of how much heat a greenhouse gas gets trapped in the atmosphere. It is indicated in kg of CO ₂ -equivalents for a specified time horizon.
Global Warming Potential biogenic, fossil, land use and land use change	GWP-fossil GWP-biogenic GWP-luluc			These are subsets of the total GWP covering the biogenic, fossil, and land use related part of the GWP. These three add up to the main climate change impact.
Ozone depletion potential	ODP	kg CFC-11 eq.	Steady-state ODPs, WMO 2014	Ozone Depletion Potential characterizes the destructive effects on the stratospheric ozone layer of anthropogenic emissions of ozone depleting substances (ODS), mainly chlorofluorocarbons (CFCs) and nitrogen oxides (NOX). It is calculated over a time horizon of 100 years.
Acidification potential	AP	Mol of H+ eq	Accumulated Exceedance, Seppälä et al., 2008	The acidification potential describes the acid deposition in plants, soils and surface waters caused by the conversion of air pollutants in acid. It is calculated as Mol of H+ eq.
Eutrophication aquatic freshwater	EP-freshwater	kg P eq	EUTREND model, Struijs et al., 2009b as implemented in ReCiPe	Aquatic eutrophication is the undesired enrichment of waters with nutrients. It induces the growth of plants and algae, which may result in oxygen depletion. At an excessive level it affects the biological balance of affected waters
Eutrophication aquatic marine	EP-marine	kg N eq.		Aquatic eutrophication potential is measured in kg of PO ₄ -eq (freshwater) and kg of N eq (marine water).

Glossary

Impact category	Abbreviation	Unit	Characterisation method	Description
Eutrophication, terrestrial	EP terrestrial	Mol N eq.	Accumulated Exceedance, Seppälä et al., 2008	Terrestrial eutrophication is the undesired enrichment of soils with nutrients. It may increase the susceptibility of plants to diseases and pests, as cause degradation of plant stability. If the nitrification level exceeds the amounts of nitrogen necessary for a maximum harvest, it can lead to an enrichment of nitrate which can cause increased nitrate content in groundwater. Terrestrial eutrophication is expressed as Accumulated Exceedance in MOLN.
Photochemical ozone formation	POCP	kg NMVOC eq.	LOTOS-EUROS, Van Zelm et al., 2008, as applied in ReCiPe	Photochemical ozone creation potential (also referred to as photochemical smog) quantifies the creation of ozone on ground-level where it is considered as a pollutant, while in the high levels of the atmosphere it protects against ultraviolet (UV) light. Ozone on lower levels is a harm to human health and can for example cause inflamed airways or damage lungs. It is expressed in kg of NMVOC -equivalents.
Abiotic depletion potential for non fossil resources	ADP-minerals and metals	kg Sb eq	CML 2002, Guinée et al., 2002 and van Oers et al 2002	Abiotic resources are natural resources which are regarded as non-living. Their current rate of depletion by humans is not considered sustainable and is cause for concern due to their scarcity. The depletion of abiotic resources is reflected in two separate impact categories: Elements, such as iron ore, indicated in kg of Sb-equivalents; and Fossil fuels, for example, crude oil indicated in MJNCV.
Abiotic depletion for fossil resources potentia	ADP-fossil	MJ, net calorific value
