The EPD owner has the sole ownership, liability, and responsibility for the EPD. EPDs within the same product category but from different programmes may not be comparable. EPDs of construction products may not be comparable if they do not comply with EN 15804.

An EPD should provide current information and may be updated if conditions change. The stated validity is, therefore, subject to the continued registration and publication at www.environdec.com.

### **Product description**

### Product description and description of use

The Environmental Product Declaration (EPD) describes the environmental impacts of 1m<sup>2</sup> of CONTRAFLAM 120, which is a fire resistant laminated glass.

CONTRAFLAM 120 is a monolithic fire resistant glass with EI120 heat insulation properties according to European standard EN 13501-2. It consists of two or more sheets of toughened safety glass. The cavity between the sheets of glass is filled with a transparent intumescent interlayer. This enables the glass to react when exposed to radiant heat and fire in order to protect life and property in living places for the specific time frame. Additionally, there is the option to add fall-out protection in the event of breakage by adding a PVB layer to create a laminated glazing to resist greater penetration.

In this Environmental Product Declaration, one m<sup>2</sup> of 2 different glazing configurations will be analyzed:

- CONTRAFLAM 120-6 ((5/4/4/5) 6 (5/4/4/5))
- CONTRAFLAM 120-5 (5/8/4/4/8/5)

#### Performance data

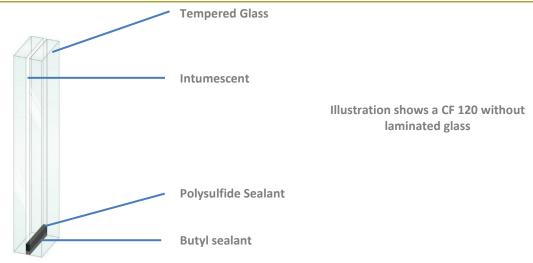

The range of CONTRAFLAM 120 is very large and can consist of various additional layers and materials, depending on the coating, the glass thickness and the number of chambers. Here are a few examples of configurations for each of the products described in this EPD.

Discover more information about the CONTRAFLAM range on <a href="www.vetrotech.com">www.vetrotech.com</a>.

| Class EN 356 (protection against vandalism and burglary) | P1A                                       | P1A                               |
|  | Acoustics properties                      |                                   |
| Rw(C;Ctr) (real test)                                    | 43 (-2; -8)                               | 47 (-2; -3)                       |

The performance data are given according to the EN 410-2011 standard for thermal and visible parameters and following the EN 12758 for the acoustic data. Fire performance data is determined according to EN13823, EN1363-1, EN1363-2 and associated test standards. Fire classification is following EN15998, EN13501-1 and EN13501-2.

### Declaration of the main product components and/or materials

The above list gives the main components of the product, including those contributing to more than 5% of any environmental impact, if any. The percentages are given for the glass make-ups mentioned in this EPD; the % may vary depending on the glazing configuration.

|                           | N° 1                            | N° 2  |   |

## LCA calculation information

| FUNCTIONAL UNIT / DECLARED UNIT          | $1  \text{m}^2$ of CONTRAFLAM EI120 to be incorporated into a building. The impacts of installation are not taken into account.  |
|--|--|
| SYSTEM BOUNDARIES                        | Cradle to gate:<br>Mandatory Stages = A1-A3  |
| EXCLUDED LIFE CYCLE STAGES               | Excluded stages = A4-A5; B1-B7; C1-C4<br>Optional stage = D  |
| REFERENCE SERVICE LIFE (RSL)             | n/a. Boundaries are cradle to gate   |
|  | All significant parameters shall be included. According to EN 15804, mass flows under 1% of the total mass input and/or energy flows representing less than 1% of the total primary energy usage of the associated unit process may be omitted. However, the total amount of energy and mass omitted must not exceed 5% per module.                      |
| CUT-OFF RULES                            | Substances of Very High Concern (SVHC), as defined in the REACH Regulation (article 57), in a concentration above 0.1% by weight, in glass final products, shall be included in the Life Cycle Inventory and the cut-off rules shall not apply.  |
|  | All inputs and outputs to the processes for which data is available were included in the calculation. No core processes were excluded. Particular care was taken to include materials and energy flows known to have the potential to cause significant emissions into air, water and soil related to the environmental indicators of the governing PCR. |
|  | No allocation. Attribution of total inputs and outputs are based on m² of production for Contraflam.   |
| ALLOCATIONS                              | Allocation of background data (energy and materials) taken from the GaBi 2016 databases is documented online at http://www.gabi-software.com/support/gabi/   |
| GEOGRAPHICAL COVERAGE<br>AND TIME PERIOD | The information was established over the year 2014. The information collected comes from the European sites producing float glass and laminated glass (SAINT-GOBAIN GLASS INDUSTRY) and the processor sites from VETROTECH SAINT-GOBAIN.   |
| BACKGROUND DATA SOURCE                   | GaBi data not older than 10 years were used to evaluate the environmental impacts  |
| SOFTWARE                                 | Gabi 8 - GaBi envision  The glass LCA model is based on an interactive GaBi tool which was verified separately in 2016. SGG_EPD tool for Building glass 1m2_2016-11-23.gmbx Initial tool was updated with most recent version data base (GaBi 8 service pack 36) products may not be comparable if they do not comply with                               |

According to EN 15804, EPD of construction products may not be comparable if they do not comply with this standard. According to ISO 21930, EPD might not be comparable if they are from different programmes. Reading note: In this document, the thousand separator and the decimal mark follow the International System; English version, *i.e* 1 234.56

### Life cycle stages

### Diagram of the Life Cycle

Relevant stages: as this is a cradle to gate the only relevant stages are A1-A3.

In conformity with EN 15804+A1, production step includes:

- Extraction and processing of raw materials;
- Generation of electricity, steam and heat from primary energy resources, also including their extraction, refining and transport;
- Transportation up to the factory gate and internal transport;
- Manufacturing of ancillary materials or pre-products;
- Manufacturing of product;
- Processing up to the end-of-waste state or disposal of final residues including any packaging not leaving the factory gate with the product.

All glasses are transported in specific trucks (inloaders), with returnable racks. Other components, like intumescent layer are delivered in drums, which are return to the supplier.

A description of the relevant stages is given for two types of CONTRAFLAM 120 configurations in the Figure 1. All configurations production are similar to these example.

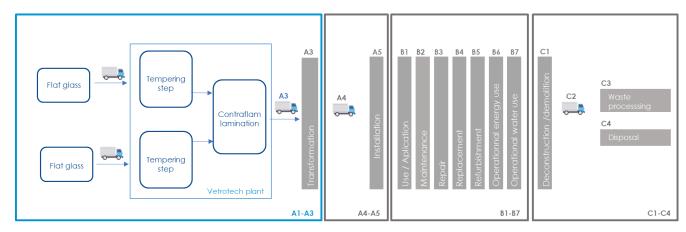

Figure 1: Relevant LCA steps for Contraflam (x/x). Steps in blue are declared in this EPD, steps in grey are not declared.

Table 1: Modules of the production life cycle included in the EPD (X = declared modules; MNA = modules not assessed)

### Product stage, A1-A3

**Description of the stage:** For CF 120, A1 to A3 represents the production of glass in the float, the transportation to the processing site, and the processing into fire resistant glass.

The product stage includes the extraction and processing of raw materials and energies, transport to the manufacturer, manufacturing and processing of flat glass.

#### Contraflam manufacturing process flow diagram

- 1. **RECEPTION AND STORAGE**: Sheets of glass arrive from float glass plants by special transport inloaders and are stored in our plants.
- 2. **CUTTING**: The right sheet of glass is automatically taken from the glass storage and cut-to-size according the customer's requirements (cut to order).
- **3. EDGE TREATMENT**: Glass edges are treated to the prescribed quality to prepare the next processing step.
- 4. **TEMPERING**: In general, all glasses are tempered to ensure the overall performance in terms of break resistance and accidental impact safety aspects. Of course we can supply every protective glass demanded within our product make-up.
- 5. **INSULATING GLASS UNIT (IGU) ASSEMBLY**: On a specially designed IGU processing-line, two pieces of glass are assembled together to create an inner chamber, made air and moisture tight by a primary and secondary sealant for maximum durability.
- 6. **INJECTION OF INTERLAYER**: The chamber is then filled in with an intumescent interlayer and filling holes are sealed.
- 7. **CURING OF INTERLAYER**: The injected interlayer is cured in a thermal treatment process to achieve transparency and hardness.
- 8. **QUALITY CONTROL**: All glass units are inspected and checked to regulatory requirements and quality standards before being packed on stillages. That gives us the possibility to meet 100% of customer needs.
- 9. **STORAGE AND TRANSPORT**: All glass units are packed on stillages and dispatched to the final place of application.

Use of sustainable light bulbs, recycling of broken glass culets, recycling of cardboard, metal, timber and installation of pollution abatement systems and closed circuit management of water: every measure is taken to limit the consumption of energy, extraction of natural resources, production of waste and emissions into the atmosphere.

## **LCA** results

The table below present the environmental impacts associated with the production of 1 square meter of CONTRAFLAM 120. This is a Cradle-to-Gate EPD. The environmental impacts of all the other stages in the life cycle of CONTRAFLAM 120 are not declared (INA).

|  | ENVIRONMENTAL IMPACTS CONTRAFLAM 120-6   |              |                        |               |                   |              |                   |                     |                              |                             |                                      |              |                        |             |                                 |

| Ozone Depletion (ODP)  kg CFC 11 equiv/FU  | Destruction of the stratospheric ozone layer which shields the earth from ultraviolet radiation harmful to life.  This destruction of ozone is caused by the breakdown of certain chlorine and/or bromine containing compounds (chlorofluorocarbons or halons).  Which break down when they reach the stratosphere and then catalytically destroy ozone molecules. |              |                        |               |                   |              |                   |                     |                              |                             |                                      |              |                        |             |                                 |

| Ozone Depletion (ODP)  kg CFC 11 equiv/FU  | Destruction of the stratospheric ozone layer which shields the earth from ultraviolet radiation harmful to life.  This destruction of ozone is caused by the breakdown of certain chlorine and/or bromine containing compounds (chlorofluorocarbons or halons).  Which break down when they reach the stratosphere and then catalytically destroy ozone molecules. |   |                    |               |                   |              |                   |                     |                                 |                                |                                       |               |                        |             |                                 |

### LCA results interpretation

CONTRAFLAM EI120 is made with tempered glasses and intumescent interlayer.

Most of CO<sub>2</sub> emissions are linked to the glass production phase, and the integration of the intumescent interlayer in the glazing.

Water consumption is linked to the electrical energy used for transformation process of the glass, and to the production of the intumescent interlayer.

|     |  | Environmental impacts (A1-A3)<br>CONTRAFLAM 120-6 | Unit                      |
|-----|--|---|---------------------------|
| COS | Global warming                                     | 2.93E+2   | kg CO <sub>2</sub> eq./FU |
|     | Non-Renewable resources consumption <sup>[1]</sup> | 3.26E+3   | MJ/FU                     |
| O   | Energy consumption <sup>[2]</sup>                  | 4.00E+3   | MJ/FU                     |
| (3) | Water consumption <sup>[3]</sup>                   | 1.15  | m³/FU                     |
|     | Waste production <sup>[4]</sup>                    | 2.72E+1   | kg/FU                     |

<sup>[1]:</sup> This indicator corresponds to the abiotic depletion potential of fossil resources.

## **Health characteristics**

#### **Indoor air quality**

Clear flat glass is an inert material that doesn't release any inorganic & organic compounds - in particular, no VOC (volatile organic compounds).

The sealant of CONTRAFLAM 120 is made of organic materials which have been tested regarding their VOC emissions (following ISO 16000 standard):

- Polysulfide: total VOC after 28 days < 38 μg/m3 (Eurofins report G07104)</li>
- Polyurethane: total VOC after 28 days < 4 μg /m3 (Eurofins report G08363).</li>

If the glass is laminated, a PVB layer is included in the glazing. The VOC emissions test (following ISO 16000 standard) rank the PVB A+ (highest rank) following the French regulation (Eurofins report G10504).

- Total VOC after 28 days < 200 μg/m³
- Formaldehyde after 28 days < 10 μg/m³</li>

<sup>[2]:</sup> This indicator corresponds to the total use of primary energy (renewable and non-renewable)

<sup>[3]:</sup> This indicator corresponds to the use of fresh net water.

<sup>[4]:</sup> This indicator corresponds to the sum of hazardous. non-hazardous and radioactive waste disposed.

### **Additional Environmental Information**

### Disposal considerations

Disposal may be in accordance with local and national legal requirements for the disposal of glass waste. The local regulations for discharging waste water in landfills and sewage treatment plants must be taken into consideration for water-soluble material. In the EU, waste code 200102 is applied (Test report 66988008 Eurofins).

### Saint-Gobain's environmental policy

Saint-Gobain's environmental vision is to ensure the sustainable development of its Activities, while preserving the environment from the impacts of its processes and services throughout their life cycle. The Group thus seeks to ensure the preservation of resources, meet the expectations of its relevant stakeholders, and offer its customers the highest added value with the lowest environmental impact.

The Group has set two long-term objectives: zero environmental accidents and a minimum impact of its activities on the environment. Short and medium-term goals are set to address these two ambitions. They concern five environmental areas identified by the Group: raw materials and waste; energy, atmospheric emissions and climate; water; biodiversity; and environmental accidents and nuisance.

### Saint-Gobain's long term objectives:

|     | Non recovered waste (2010-2025): -50%  |  |  |  |  |  |  |  |
|-----|--|--|--|--|--|--|--|--|
|     | Long-term: zero non-recovered waste  |  |  |  |  |  |  |  |
|     | Energy consumption: -15% (2010-2025)   |  |  |  |  |  |  |  |
| COS | CO <sub>2</sub> emissions: -20% (2010-2025)  |  |  |  |  |  |  |  |
|     | Emissions of NOx. SO <sub>2</sub> and dust: -20% for each emissions category (2010-2025) |  |  |  |  |  |  |  |
|     | Water discharge: -80% (2010-2025)  |  |  |  |  |  |  |  |
|     | Long-term: zero industrial water discharge in liquid form                                |  |  |  |  |  |  |  |
| T T | 2025: promote the preservation of natural areas at Company sites as much as possible     |  |  |  |  |  |  |  |
|     | 2025: all environmental events are recorded. registered and investigated                 |  |  |  |  |  |  |  |

More information on our website: www.saint-gobain.com and our Registration Document.

### Our products' contribution to Sustainable Buildings

Saint-Gobain encourages sustainable construction and develops innovative solutions for new and renovated buildings that are energy efficient, comfortable, healthy and esthetically superior, while at the same time protecting natural resources.

The following information might be of help for green building certification programs:

### **RECYCLED CONTENT**

(Required for LEED v4 Building product disclosure and optimization - sourcing of raw materials)

Recycled content: proportion (by mass) of recycled material in a product or packaging. Only preconsumer and post-consumer materials shall be considered as recycled content.

 Post-consumer material: material generated by households or commercial, industrial and institutional facilities in their role as end-users of the product which can no longer be used for its intended purpose.

In practice, in the case of flat glass, all material coming from glass recycling collection schemes falls under this category, i.e. glass waste from end-of-life vehicles, construction and demolition waste, etc.

• Pre-consumer material: material diverted from the waste stream during a manufacturing process. Excluded is reutilization of materials such as rework, regrind, or scrap generated in a process and capable of being reclaimed within the same process that generated it.

In the case of flat glass, this waste originates from the processing or re-processing of glass that takes place before the final product reaches the consumer market. Pre-consumer waste flat glass is made of cut-off, losses during laminating, bending and other processing, including the manufacture of insulating glass units or automotive windscreens.

Cullet generated in the furnace plant and which is reintroduced into the furnace cannot be considered as pre-consumer recycled content, since there was never intent to discard it and therefore it would never have entered the solid waste stream.

| Pre-consumer cullet  | ~7%  |
|----------------------|------|
| Post-consumer cullet | < 1% |

In the future, Saint-Gobain Glass intends to continue the increase of recycled material in its products, especially when recycling building post-consumer cullet glass dismantling and recycling networks will be available in every country.

#### **RESPONSIBLE SOURCING**

(Required for BREEAM International new construction 2013 – MAT 03 Responsible sourcing)

Romont (Switzerland) and Namyslow (Poland) Vetrotech Saint-Gobain factories are certified ISO 14001. Kinon Aachen (Germany) is also certified ISO 50001 (Energy management).

All Saint-Gobain Glass Industry sites with a glassmaking furnace, are ISO 14001 certified.

All internal Saint-Gobain Glass quarries are certified ISO 14001 like for example SAINT-GOBAIN SAMIN (sand) in France. Many Saint-Gobain Glass raw material suppliers are certified ISO 14001. Our policy consists in encouraging the sourcing of raw materials extracted or made in sites certified ISO 14001 (or the equivalent).
