

ENVIRONMENTAL PRODUCT DECLARATION

In accordance with ISO 14025 and EN 15804:2012+A2:2019 for

FLAT GLASS

3 mm - 19 mm Clear and colored flat glass

Version 1
Date of issue: 2022-09-20
Validity: 5 years
Valid until: 2027-09-20

Scope of the EPD®: Brazil

The environmental impacts of this product have been assessed over its whole life cycle. Its Environmental Product Declaration has been verified by an independent third party.

Disclaimer: EPD of construction products may not be comparable if they do not comply with EN 15804

Product description

Product description and description of use

This Environmental Product Declaration (EPD®) describes the environmental impacts of 1 m² of FLAT GLASS to 3 mm to 19 mm with a light transmittance of maximum 91%*, for an expected average service life of 30 years.

This EPD is an average of 2 glass production sites in Brazil. The calculated average is a weighted arithmetic mean of the production of Cebrace's sites located at Jacareí/São Paulo and Barra Velha/Santa Catarina.

FLAT GLASS can be incorporated into a building, furniture or industrial application. The impacts of installation are not taken into account.

*Check table 1, below, with all the performance data according to the thickness and colour.

FLAT GLASS is a basic soda-lime silicate glass produced using the float procedure to be used in building, furniture & industrial applications. This glass is in conformity with the Mercosur standard NM 294-2004.

Specific make-ups described in this EPD:

In this Environmental Product Declaration one square meter of an average flat glass product will be analyzed taken into account the production of:

- Cebrace Float Clear: clear flat glass is a clear, sheet glass produced from soda-lime silicates, along with metal-oxide materials which are used in the creation of tinted glasses.
- Cebrace Extra Clear: which is a low iron product that reduces the level of green coloring so that
 the appearance is clearer and more neutral. This is particularly noticeable when viewing the
 edge of the glass.
- Cebrace Float Green, Dark Green (Emerald), Grey and Bronze: which are colored or tinted glasses are primarily the same composition as clear glass with minor adjustments to account for the addition of colorants.

The products are commonly used for building applications such as windows, walls, etc. The declared glass products are available in a range of thicknesses. The thicknesses included in this report are those more common in the commercial and residential markets.

Clear glasses represent 81% of the production, colored glass 19%.

Performance data:

The range of FLAT GLASS is very large and can be personalized according to its thickness mainly. Below are a few examples of configurations for each of the products described in this EPD. Discover more information about the FLAT GLASS range on: https://www.cebrace.com.br/
The performance data are given according to the EN 410-2011 standard.

Declaration of the main product components and/or materials

The product is 100% glass CAS number 65997-17-3, EINECS number 266-046-0.

Description of the main components and/or materials for 1 m² of FLAT GLASS to 3 mm to 19 mm.

Thickness (mm)	3	3.15	4	5	6	8	10	12	15	19
Quantity of glass for 1 m ² of product (kg)	7,5	7,87	10	12,5	15	20	25	30	37,5	47,5

There is no "Substance of Very High Concern" (SVHC) in concentration above 0.1% by weight, and neither do their packaging, following the European REACH regulation (Registration, Evaluation, Authorization and Restriction of Chemicals).

Packaging and product used: Wooden battens (0.0049 kg of wood/kg of glass)

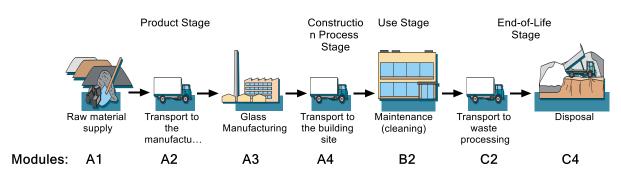

LCA calculation information

FUNCTIONAL UNIT / DECLARED UNIT	1 m ² of FLAT GLASS to 3 mm to 19 mm.
SYSTEM BOUNDARIES	Cradle to grave and module D Mandatory Stages = A1-A3; B1-B7; C1-C4 and D
REFERENCE SERVICE LIFE (RSL)	According to PCR EN 17074:2019, the reference service life is 30 years
CUT-OFF RULES	All significant parameters shall be included. According to EN 15804, mass flows under 1% of the total mass input; and/or energy flows representing less than 1% of the total primary energy usage of the associated unit process may be omitted. However, the total amount of energy and mass omitted must not exceed 5% per module. The energy used for the installation of 1m² of glass, as well as minor amounts of solid waste flows from the glass manufacturing process are included in the cut-off rules for the LCA model.
ALLOCATIONS	Wastes from the glass manufacturing process to recycling are considered co-products. In a conservative approach, 100% of impacts have been allocated to the reference product. No other allocation procedure has been performed on the foreground processes. The ecoinvent database used to model the background processes applies an economic allocation procedure.
GEOGRAPHICAL COVERAGE AND TIME PERIOD	The information was established over the year 2019. The information collected comes from the two sites producing FLAT GLASS in Brazil (CEBRACE CRISTAL PLANO)
BACKGROUND DATA SOURCE	Ecoinvent 3.8 (cut-off model) data were used to evaluate the environmental impacts. Primary data from suppliers of sand, lime and dolomite have been collected.
SOFTWARE	SimaPro 9.3

According to EN 15804, EPD of construction products may not be comparable if they do not comply with this standard. According to ISO 21930, EPD might not be comparable if they are from different programmes.

Life cycle stages

Flow diagram of the Life Cycle

Product stage, A1-A3

For flat glass A1 to A3 represents the production of glass in the float from cradle to gate.

Description of the stage: the product stage of flat glass is subdivided into 3 modules A1, A2 and A3 respectively "Raw material supply", "transport to manufacturer" and "manufacturing".

A1, raw material supply.

This includes the extraction and processing of all raw materials and energy which occur upstream from the manufacturing process.

A2, transport to the manufacturer.

The raw materials are transported to the manufacturing site. The modelling includes road and/or boat transportation of each raw material.

A3, manufacturing.

This module includes the manufacture of products and the manufacture of packaging. The production of packaging material is taken into account at this stage. The processing of any waste arising from this stage is also included.

The product stage includes the extraction and processing of raw materials and energies, transport to the manufacturer, manufacturing and processing of flat glass.

Manufacturing process flow diagram

- 1. **BATCH MIXER:** Mix of raw materials (silica, soda ash, lime, feldspar and dolomite) to which is added recycled glass (cullet) and other compounds depending on the desired color and properties.
- 2. **FUSION FURNACE**: Raw materials are melted at 1,550°C in a furnace.
- 3. **FLOAT:** The molten glass is fed into a bath of molten tin. The glass floats on this flat surface and is drawn off in a ribbon. Serrated wheels, or top rolls, pull and push the glass sideways depending on the desired thickness (from 3 to 19 millimeters).
- 4. **Annealing Lehr:** The glass is lifted onto conveyor rollers and passes through a controlled cooling tunnel measuring more than 100 meters in length. Approximately 600°C at the start of this step, the glass exits the lehr at room temperature.
- 5. **CUTTING AND STACKING:** The glass is automatically cut lengthwise and crosswise. The sheets of glass are raised by vacuum frames that then place them on glass stillages.
- 6. **QUALITY:** Automatic inspections and regular samples are taken to check the quality of the glass at each step in the glassmaking process.
- 7. **STORAGE AND TRANSPORTATION:** The stillages are placed on storage racks in the warehouse.
- 8. **Environment**: Use of recycled cullet, installation of pollution abatement systems and closed circuit management of water: every measure is taken to limit the consumption of energy, extraction of natural resources, production of waste and emissions into the atmosphere.

The flat glass is transported on dedicated racks or wooden battens, used many times. Racks are not included in the life cycle of the product according to the cut-off rules.

Construction process stage, A4-A5

Description of the stage: The construction process is divided into 2 modules: A4, transport to the building site and A5, installation in the building.

A4, Transport to the building site:

This module includes transport from the production gate to the building site.

Transport is calculated based on a scenario with the parameters described in the following table. The calculated distance represents Cebrace's weighted average for the products distributed in 2019.

PARAMETER	VALUE
Distance	1267 km
Bulk density of transported products	2500 kg/m3

A5, Installation in the building:

The accompanying table show the parameters for installing the product at the building site. No installation materials and waste were considered due to the cut-off rule applied.

PARAMETER	VALUE
Ancillary materials for installation (specified by materials)	According to PCR NF EN 17074, none ancillary materials considered
Other resource use	None
Quantitative description of energy type (regional mix) and consumption during the installation process	According to EN 15804+A1, the energy needed during the installation is less than 0,1% of the total life cycle energy. It's include in the cut-off-rules.
Wastage of materials on the building site before waste processing, generated by the product's installation (specified by type)	According to PCR EN 17074, no waste is considered.
Output materials (specified by type) as results of waste processing at the building site e.g. of collection for recycling, for energy recovering, disposal (specified by route)	None
Direct emissions to ambient air, soil and water	None

Use stage (excluding potential savings), B1-B7

Description of the stage: The use stage is divided into the following modules:

B1: Use

B2: Maintenance

B3: Repair

B4: Replacement

B5: Refurbishment

B6: Operational energy use

B7: Operational water use

The product has a reference service life of 30 years. This assumes that the product will last in situ with no requirements for repair, replacement or refurbishment throughout this period. Therefore, it has no impact at this stage, except for maintenance.

According to PCR EN 17074, only the maintenance by cleaning glass with water and cleaning agent is included in this study.

Maintenance parameters, B2:

PARAMETER	VALUE (expressed per functional/declared unit)
Maintenance process	Water and cleaning agent
Maintenance cycle	Annual average
Ancillary materials for maintenance (e.g. cleaning agent, specify materials)	cleaning agent : 0,001 kg/m² of glass/year
Wastage material during maintenance (specify materials)	0 kg
Net fresh water consumption during maintenance	0,2 kg/m² of glass/year
Energy input during maintenance (e.g. vacuum cleaning), energy carrier type, (e.g. electricity) and amount, if applicable and relevant	None required during product lifetime

End of Life Stage, C1-C4

Description of the stage: This stage includes the next modules:

C1: Deconstruction, demolition

C2: Transport to waste processing

C3: Waste processing for reuse, recovery and/or recycling

C4: Disposal

End of life scenario used in this study is:

- 100% of glass goes to the average Brazilian solid waste landfill scenario. The distance to the disposal site considered is 50 km. The disposal scenario consists of 60% sanitary landfills, 23% unsanitary landfills and 17% open dumps.

Reuse/recovery/recycling poten	itial	. D
--------------------------------	-------	-----

Description of the stage: An end-of-life recycling of 0% (100% of glass wastes are landfilled) has been assumed as a conservative approach due to local demolition waste data uncertainties.

LCA results

Product Environmental Footprint (PEF) method has been used as the impact model with the adaptations required by EN 15804:2012+A2:2019. Specific data has been supplied by the plant, as well as by the sand, lime and dolomite suppliers; and generic data come from econivent 3.8 and USLCI (United States Life Cycle Inventory) databases.

All emissions to air, water, and soil, and all materials and energy used have been included. Raw materials and energy consumption, as well as transport distances, have been taken directly from the manufacturing plant (production data according to 2019).

All result tables refer to a functional unit of 1 m² of flat glass and an expected average service life of 30 years.

The core indicators from the PEF method are reported in this EPD (i.e. Climate Change, Climate change - Fossil, Climate change - Biogenic, Climate change - Land use and LU change, Ozone depletion, Acidification, Eutrophication – freshwater, Eutrophication – marine, Eutrophication – terrestrial, Photochemical ozone formation, Resource use – minerals and metals¹, Resource use – fossil¹, and Water Use¹. The additional indicators for the categories Ionizing Radiation², Particulate Matter, Land Use¹, Human Toxicity – cancer¹, Human Toxicity – Non-cancer¹, and Ecotoxicity – freshwater¹ are not declared.

Specific data used		<90	0%		-	-	-	-	-	-	-	-	-	-	-	-	-
Variation products		Not re	levant		-	-	-	-	-	-	-	-	-	-	-	-	-
Variation sites		-17 to	+4%		-	-	-	-	-	-	-	-	-	-	-	-	-

According to the PCR, the variation for the GWP indicators has been calculated for the two different sites and compared to the product groups formed as averages (similar products from different plants). The variation between the different manufacturing sites and the average is from -17% to 4%. The variation of the sites comes from the energy efficiency of the plants.

² Disclaimer 2 – This impact category deals mainly with the eventual impact of low dose ionizing radiation on human health of the nuclear fuel cycle. It does not consider effects due to possible nuclear accidents, occupational exposure nor due to radioactive waste disposal in underground facilities. Potential ionizing radiation from the soil, from radon and from some

construction materials is also not measured by this indicator.

¹ Disclaimer 1 - The results of this environmental impact indicator shall be used with care as the uncertainties on these results are high or as there is limited experienced with the indicator.

Information on biogenic carbon content

Results per fund	ctional or declared uni	it
BIOGENIC CARBON CONTENT	Unit	QUANTITY
Biogenic carbon content in product	kg C	0
Biogenic carbon content in packaging (3 mm)	kg C	1,83E-02
Biogenic carbon content in packaging (3,15 mm)	kg C	1,92E-02
Biogenic carbon content in packaging (4 mm)	kg C	2,44E-02
Biogenic carbon content in packaging (5 mm)	kg C	3,05E-02
Biogenic carbon content in packaging (6 mm)	kg C	3,67E-02
Biogenic carbon content in packaging (8 mm)	kg C	4,89E-02
Biogenic carbon content in packaging (10 mm)	kg C	6,11E-02
Biogenic carbon content in packaging (12 mm)	kg C	7,33E-02
Biogenic carbon content in packaging (15 mm)	kg C	9,16E-02
Biogenic carbon content in packaging (19 mm)	kg C	1,16E-01

Note: 1 kg biogenic carbon is equivalent to 44/12 kg CO_2 .

There is no biogenic carbon in glass product.

LCA results interpretation for FLAT GLASS 4 mm

The following figure refers to a functional unit of 1 m² of flat glass product with 4mm thickness.

Global Warming Potential (Climate Change) (GWP)

When analyzing the above figure for GWP, it can clearly be seen that the majority of contribution to this environmental impact is from the production modules (A1 - A3). This is primarily because the sources of greenhouse gas emissions are predominant in this part of the life cycle. CO_2 is released on site by the combustion of natural gas and geogenic emissions released by raw materials during the fusion. Production of one of raw material will generate the third highest percentage of greenhouse gas emissions. The production modules contribute to over 85% of the contribution and the transportation of the product to the client represents 11% of the category result.

Non-renewable resources consumptions

The consumption of non – renewable resources is once more found to have the highest value in the production modules (87%). This is because a large quantity of natural gas is consumed within the factory. The contribution to this impact from the other modules is primarily due to the non–renewable resources consumed during transportation (12%).

Energy Consumptions

Modules A1 - A3 have the highest contribution to total energy consumption (85%). Energy in the form of natural gas is consumed in a vast quantity during the manufacture of glass so we would expect the production modules to contribute the most to this impact category.

Water Consumption

For the production phase, water is used within the manufacturing facility and it represents the highest contribution (86%). However, most of water is recycled in the process. Water is also consumed during the use phase to cleaning the product representing 11% of the total consumption.

Waste Production

Waste production does not follow the same trend as the above environmental impacts. The largest contributor is the end of life module. This is because 100% of the product is sent to landfill.

Health characteristics

Concerning the indoor air quality, clear flat glass is an inert material that doesn't release any inorganic & organic compounds, in particular no VOC (volatile organic compounds).

Additional Environmental Information

Cebrace's environmental policy

Cebrace's environmental vision is to ensure the sustainable development of its Activities, while preserving the environment from the impacts of its processes and services throughout their life cycle. The Group thus seeks to ensure the preservation of resources, meet the expectations of its relevant stakeholders, and offer its customers the highest added value with the lowest environmental impact.

Our products' contribution to Sustainable Buildings

Cebrace encourages sustainable construction and develops innovative solutions for new and renovated buildings that are energy efficient, comfortable, healthy and esthetically superior, while at the same time protecting natural resources.

The following information might be of help for green building certification programs:

RECYCLED CONTENT

(Required for LEED v4 Building product disclosure and optimization - sourcing of raw materials)

Recycled content: proportion, by mass, of recycled material in a product or packaging. Only pre-consumer and post-consumer materials shall be considered as recycled content.

Pre-consumer material: material diverted from the waste stream during a manufacturing process. Excluded is reutilization of materials such as rework, regrind, or scrap generated in a process and capable of being reclaimed within the same process that generated it.

In the case of flat glass, this waste originates from the processing or re-processing of glass that takes place before the final product reaches the consumer market. Pre-consumer waste flat glass is made of cut-offs, losses during laminating, bending and other processing, including the manufacture of insulating glass units or automotive windscreens.

Cullet generated in the furnace plant and which is reintroduced into the furnace cannot be considered as preconsumer recycled content, since there was never an intent to discard it and therefore it would never have entered the solid waste stream.

Pre-	
consumer	4,3%
cullet	
Post-	
consumer	~ 0%
cullet	

In the future, Cebrace intends to continue the increase of recycled material in its products.

RESPONSIBLE SOURCING

(Required for BREEAM International new construction 2013 – MAT 03 Responsible sourcing)

All Cebrace's sites with a glassmaking furnace, are ISO 14001 certified.

For any other question / document / certification, please contact our local sales teams.
