TECNOCAP GROUP

Founded in Italy in 1993, Tecnocap Group is a multinational company operating in the metal packaging sector through the industrial production of Metal Closures for glass and plastic containers and Aluminum Aerosol Cans and Bottles. The Tecnocap Group operates on the global market with five production facilities in Europe (Italy, Czech Republic and Ukraine), two in the United States, one in India, one currently being completed in Brazil and one more acquisition in progress in Saudi Arabia. The Group also has two commercial and distribution companies and three promotional service companies.

EUROPE •

- Italy (Cava de' Tirreni, Lecco, Aprilia),
Czech Republic, Ukraine
- Italy, Germany, France, Denmark, Norway, Sweden,
Finland, Iceland, Greece, Slovenia, Croatia,
Serbia, Bosnia & Herzegovina, Montenegro, North
Macedonia, Albania, The Netherlands, Belgium,
Luxemburg, Slovakia, Poland, Moldova, Ukraine,
Hungary, Romania, United Kingdom, Ireland,
Germany, Austria, Switzerland, Spain, Portugal

NORTH AMERICA •

- USA (West Virginia, Ohio)
- USA (AL, AR, AZ, CO, IA, IL, KS, LA, MS, MO, MN, MS, ND, NE, OK, SD, TN, TX, WI, CT, GA, MA, ME, NC, NH, NJ, RI, SC, VT, NY, DE, IN, MD, MI, PA, FL, KY, OH, VA, WV, AK, CA, HI, ID, MT, NV, OR, UT, WA, WY), Canada

LATAM •

- Brazil (São Paulo)
- Brazil, Peru, Colombia, Mexico, Argentina

MIDDLE EAST •

- Saudi Arabia (in progress)
- Saudi Arabia, Egypt

INDIA •

- Maharashtra (Murbad)
- Maharashtra (Mumbai)

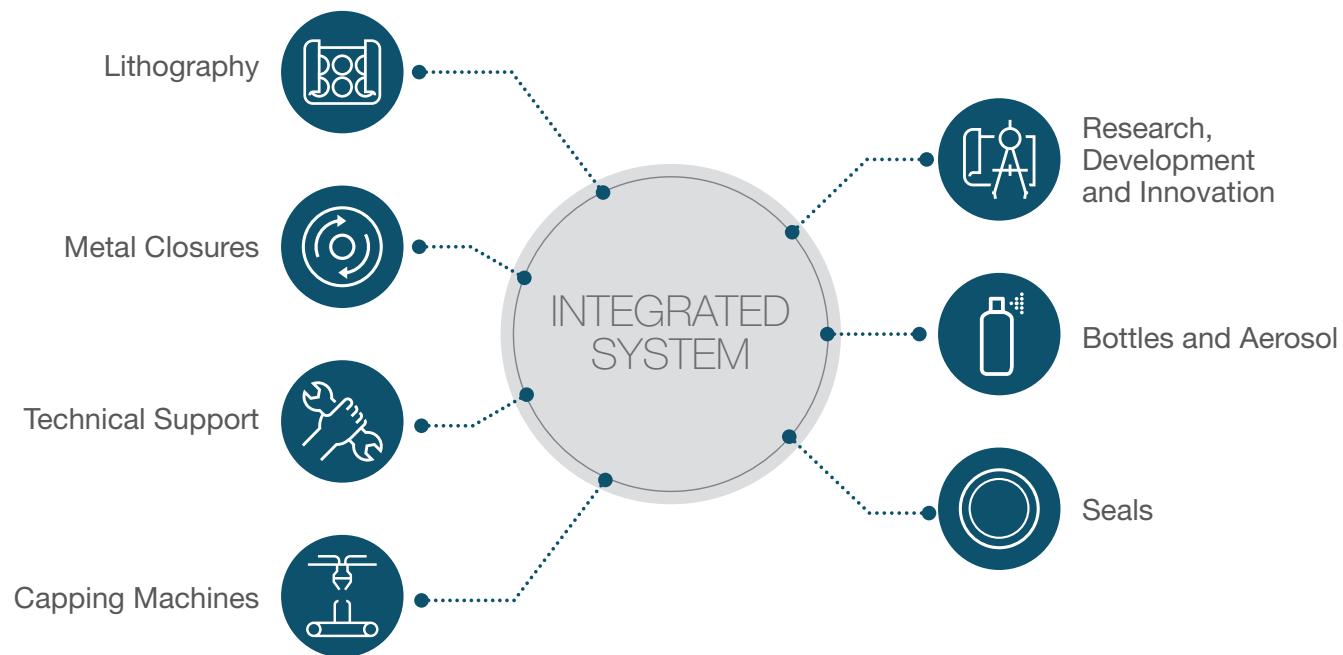

The Group's business model is founded on the seamless integration of know-how, technologies, products, and services. Tecnocap delivers metal packaging to leading FMCG industry brands, crafted with highly customized technical specifications crucial for ensuring maximum consumer safety, product integrity on the shelf, and the long-term preservation of its characteristics.

Additionally, the Group specializes in designing and producing machines and complete systems for the high-speed automatic closure of containers. It provides worldwide technical assistance services conducted at customer-operated sites to guarantee the continuity and perfect maintenance of the supplied machines.

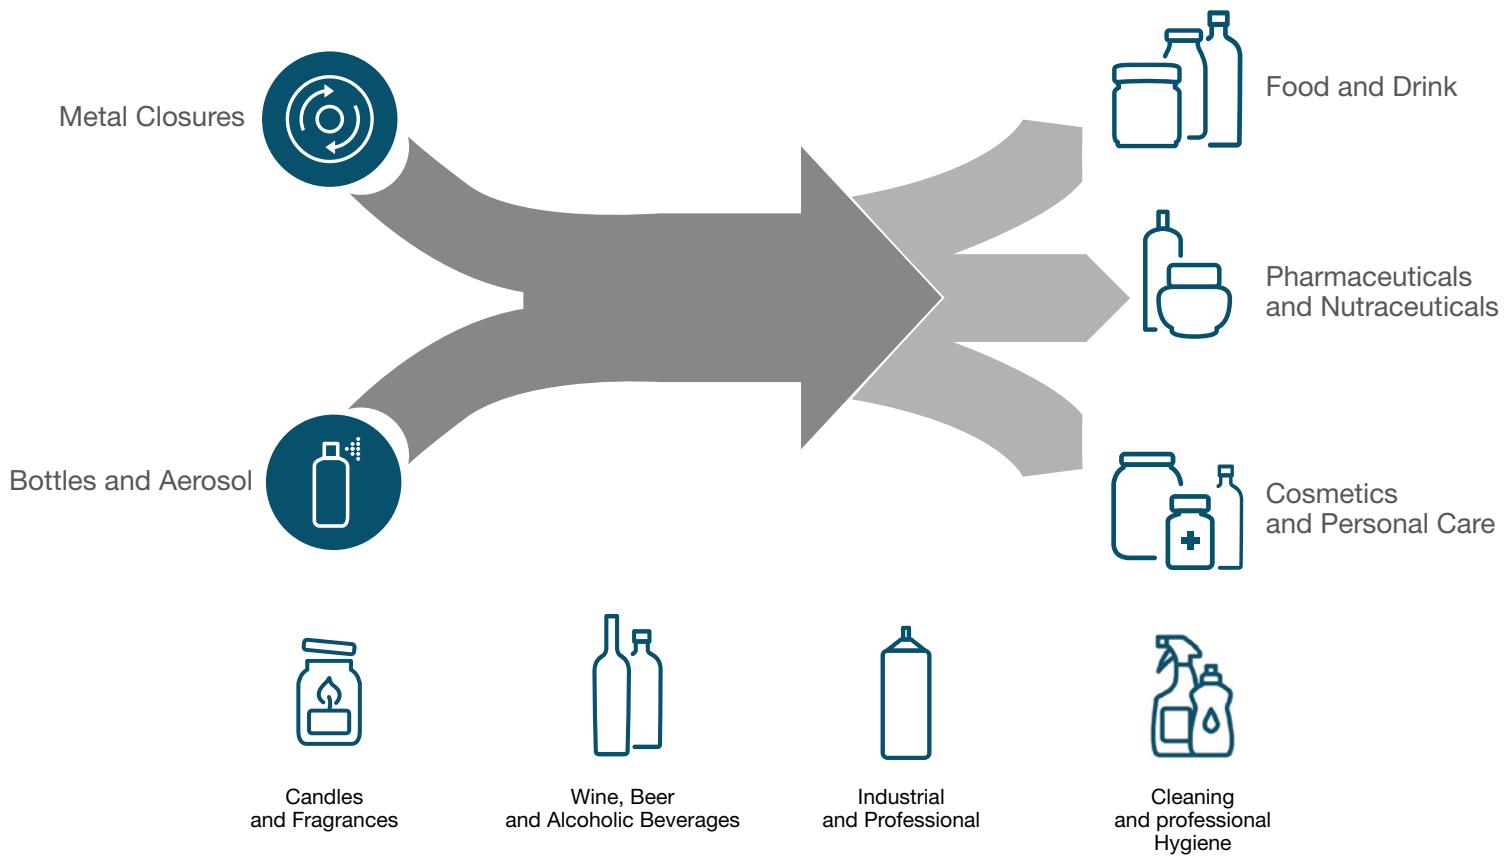

An integral component of the business model is specialized consulting aimed at researching and developing innovative solutions to meet the growing demands of global consumer brands in terms of maximum consumer safety, eco-compatibility, and visual impact.

The sustainable growth business model builds on the integration of ESG factors into the business model and the implementation of a Circular Strategy both in Manufacturing and Sourcing as well as the strengthening of strategic cooperation with all the Stakeholders.

AEROBAL

Purpose driven

Together with all the actors of our Value Chain, we work towards a future where the recycling of packaging achieves perfection and is transformed into a common daily practice. In this respect more and more products on the shelf, across all markets and geographic areas, are packaged in fully “closed loop” recyclable packaging and technologies enable the industry to achieve ever more ambitious goals in terms of competitiveness and sustainability.

PRODUCT DESCRIPTION

Tecnocap Manufactures two types of Aluminum Packaging solutions in the plant of Lecco, Italy.

Monobloc Aerosol Cans

Bottles

ALUMINUM MONOBLOC AEROSOL CANS

Tecnocap aluminum aerosol cans feature a “monobloc” construction, consisting of a single piece with no joins. It is a leak-proof sealed container with no welds, offering excellent resistance to internal pressure (standard: 12 and 18 bars).

- High quality standards and excellent barrier properties
- Suitable for use with all types of propellants and formulations
- Easy to store, allow safe handling along the entire supply chain

Printing options:

- 7 colors and more

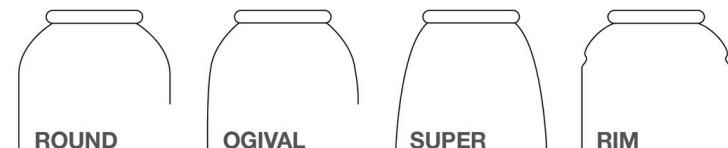

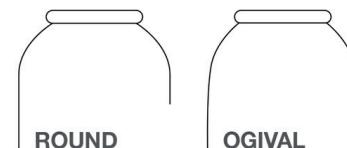

Special finishes and unlimited design possibilities:

- Glitter effect
- Pearlescent effect
- Brushed aluminum effect
- Multicolor coatings
- Matt and gloss finish

SUPER OGIVAL
Bullet/Trimline

Available on
Round, Ogival
and Flat

ALUMINUM BOTTLES

Tecnocap designs and manufactures a wide range of aluminum bottles available in various shapes, sizes and formats. Unbreakable, resistant to rust and lightweight (the latter being an important characteristic for e-commerce in particular), this type of metal packaging is easy to transport and protects products also from light and oxygen. The bottles are printed according customer requirements in up to seven colors using a superior dry offset printing process.

Main features:

- Distinctive and elegant appearance
- Damage-resistant
- Protection from external elements and light
- Ultra-lightweight and 100% recyclable
- Suitable for all types of filling (cold/hot)
- Cool-touch effect and quick cooling of beverages
- Compatible with existing bottling systems
- Closing options: Screw cap, ROPP, Crown cap

More information:

<https://www.tecnocapclosures.com/product/aluminum-bottles/>

Aluminum bottles guarantee excellent insulation protecting, thus, the functional characteristics of the product and prevent oxidation.

Aluminum bottles are also playing a fundamental role in contrasting food losses and damage during transport, due to their long-life capabilities and barrier function against contaminants, oxygen, nitrogen and carbon dioxide, water vapor and light. Finally, aluminum bottles are invulnerable to rodent and insect attacks, preventing the intrusion of aggressive agents and, at the same time, the spill of essential elements that determine food and beverage quality.

Aluminum bottles are playing also an increasingly important role in the conveyance of data, information and messages, nutritional information, and traceability of ingredients through the growing use of Qr-Codes and, in the future, Blockchain and NFT technologies.

MANUFACTURING PROCESS

Aluminum is made from a material found in the Earth's crust. It occurs naturally in a mineral called bauxite. The aluminum in bauxite is formed when the material is refined to remove impurities.

The refining process produces a fine, white powder called alumina or aluminum oxide. Electricity "zaps" the aluminum powder with a continuous electric current, which separates the aluminum from the oxygen.

The electricity melts the aluminum so that it is hot and bubbly, like lava. Next, small amounts of other metals are added to the molten aluminum to add strength and corrosion resistance to the final product (the addition of zinc to aluminum - in conjunction with some other elements, primarily magnesium and/or copper - produces heat-treatable aluminum alloys of the highest strength). The molten metal is cast into ingots or blocks, which are then melted again and shape-casted into slugs (metal disks that are impact extruded to make aerosol cans and bottles).

Packaging from aluminum slugs

The production process for both aerosol cans and bottles starts applying a large force on an aluminum disc or "slug" to extrude the base shape. The parts are subsequently thinned to approximately 0.40 mm through an ironing process and trimmed to specified lengths. The cans are washed in alkaline-based detergent washing chambers and dried in an oven. To protect against corrosion – and to remove the possibility of interaction between the packaging and its contents – a protective lacquer is used to line the interior of the cans.

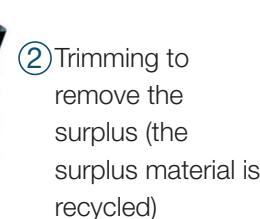

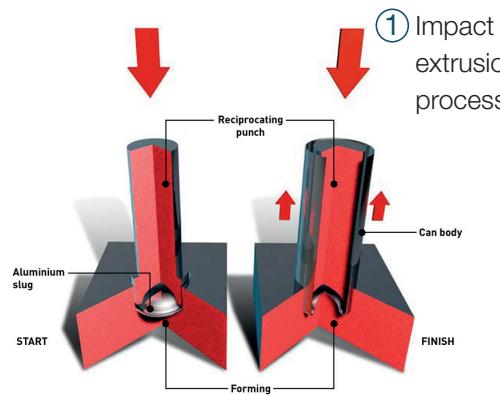

Advanced lithography techniques are then applied to give cans a differentiated, premium look and feel.

This includes the application of stain-resistant surface coating, decorative prints and over-varnish protecting the print surface.

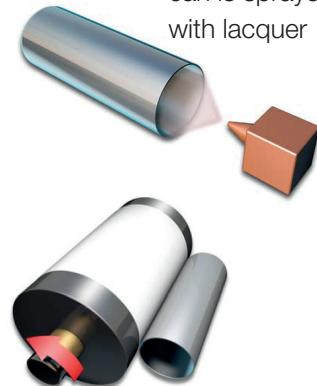

Finally, a neckdown process forms the shoulder and neck of the can. After this, cans are ready to be bundled, palletized, and shipped to customers.

MANUFACTURING PROCESS

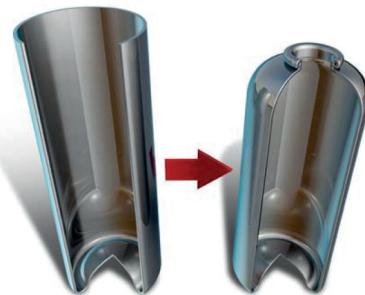

④ The inside of each can is sprayed with lacquer

⑤ External coating with a clear or pigmented base coat

⑨ Forming process to create a smooth top and roll flange to accept the aerosol valve/spray mechanism

PURE Innovation in Ecodesign

Since 2019, in partnership with a European aluminum producer, Tecnocap has launched a number of tests to produce a line of Aerosol Cans and Reusable Bottles made entirely from traceable and certified post-consumer recycled aluminum (PCR), with the aim of being the first operator to launch this innovation in Europe.

In 2020 Tecnocap launched the “PURE” line of aluminum bottles and aerosols, made entirely of post-consumer recycled aluminum, a recycling operation that is particularly relevant since it takes place at the end of the product’s life cycle, i.e. at the end of the use and reuse phase.

Therefore, in the production of “PURE”, the use of virgin materials in each new production cycle is avoided, reducing the amount of material sent to landfill. The traceability of the recycled content is certified for each batch by European aluminum suppliers, partners of Tecnocap. In 2021, the bottle made of 100% post-consumer recycled (PCR) aluminum received the Metal Packaging of the Year award at the UK Packaging Awards. It was described by the judges, as not only a breakthrough in the bottled water market, but also as *the most innovative solution in the Metal Packaging industry*.

Once produced, it can be used, reused and recycled infinitely, minimizing the likelihood of becoming waste in the environment, without any loss of its properties. The pack reached its maximum international standing at COP 26, the United Nations Climate Change Conference, held in Glasgow from 31 October to 12 November 2021. Tecnocap was commissioned by a customer brand to produce a limited edition of customized bottles made entirely of PCR aluminum.

LCA INFORMATION

Functional unit / declared unit

The Declared Unit is a unit of packaging belonging to the product's categories considered in the study (Aluminum Aerosol Cans and Aluminum Bottles)

Time representativeness

Data used in the LCA study refer to the products manufactured in the year 2021

Database(s) and LCA software used

Ecoinvent® 3.8 - Simapro® 9.4.0.2

System diagram

System diagram of the processes included in the LCA study divided into Life Cycle Stages and into Life Cycle Modules:

| LIFE CYCLE STAGE | LIFE CYCLE MODULE | | |
|------------------|-------------------|--|------|
| UPSTREAM | A1 | Raw material supply | X |
| CORE | A2 | Transport | X |
| | A3 | Manufacturing | X |
| DOWNTREAM | A4 | Transport to forming or filling | MND* |
| | A5 | Forming | MND* |
| | B1 | Filling operations | MND* |
| | B2 | Distribution of filled packaging | MND* |
| | B3 | Transport to reconditioning | MND* |
| | B4 | Reconditioning | MND* |
| | B5 | Transport to re-filling point | MND* |
| | C1 | Disassembling/sorting | MND* |
| | C2 | Transport to recovery/disposal of distribution packaging | X |
| | C3 | Final disposal of distribution packaging | X |

* Module Not Disclosed

Description of system boundaries

System boundaries are “cradle to gate with options” as they include the production of aluminum ingots, the subsequent shaping into slugs and extrusion process, painting operations, as well as the packaging for product shipping.

Considering the relevant quantity of packaging associated with products shipping, an end-of-life scenario for packaging materials was also modeled with reference to Italian data on EOL of packaging materials (source: Fondazione per lo Sviluppo Sostenibile, “Italy of recycling 2021”) and included in the study. The Italian scenario was preferred as it is the prevailing one over the total of the other destinations of Tecnocap’s Aluminum Aerosols and Bottles customers.

DISTRIBUTION PACKAGING END OF LIFE SCENARIO

| | | |
|----------------------------|--------------|--------|
| | Recycling | 87% |
| Corrugated paper packaging | Incineration | 7,50% |
| | Landfill | 5,50% |
| Plastic packaging | Recycling | 49% |
| | Incineration | 44,60% |
| | Landfill | 6,40% |

Excluded lifecycle stages

Modules from A4 to C1 of the “packaging” PCR system diagram have been excluded; modules C2 and C3 have been included only for the end of life scenario of the distribution packaging of aluminum aerosol cans and bottles.

Environmental performance indicators

Below are the environmental performance indicators represented, according to the default list v. 2.0 Updated 03.29.2022 of the International EPD® System.

- Climate Change (kg CO₂eq)
Fossil – biogenic - land use and land use change (luluc), and total
- Acidification Potential (AP) (mol H⁺ eq)
- Eutrophication Potential (EP);
 - EP, aquatic freshwater, (kg P eq)
 - EP aquatic marine (kg N eq)
 - EP, terrestrial, (mol N eq)

- Photochemical ozone creation potential (POCP) (kg NMVOC eq.);
- Ozone depletion potential (ODP) (kg CFC-11 eq)
- Abiotic depletion potential (ADP) for minerals/metals (non-fossil resources) (kg Sb eq)
- Abiotic depletion potential (ADP) for fossil resources (MJ)
- Water deprivation potential (WDP) (m³ eq)

For the results of the impact indicators, the characterization factors of the EF v.1.01 method were used.

For data processing, the SimaPro software version 9.4.0.2 and the Ecoinvent database were used.

DIFFERENCES FROM THE PREVIOUS EPD®

Compared to the 2019 LCA study relating to Tecnocap TL productions, the following factors were considered/integrated/modified in this study:

- In accordance with the version 1.1 of the “packaging” PCR, all impacts were related to a packaging unit and not to one ton of product.
- A better and more detailed allocation of the weights of the individual materials making up the aluminum packaging (metal, paint, varnish) has been carried out.
- All data have been updated and recalculated on the basis of the production results for the year 2021.
- Updated Simapro software version (9.4.0.2) and Ecoinvent v. 3.8 were used to calculate the environmental impacts along with the EF v.1.01 method as it is more in line with the environmental performance indicators of the list v. 2.0 (updated 03/29/2022) of the International EPD® System.
- Adopted GPI 3.1 for the international EPD® System instead of version 3.0.
- Compared to the previous LCA, GWP impact decreased by 24,15%. The reasons for this reduction lie, in addition to a general efficiency improvement of all processes, in the adoption in 2021 of a CHP plant fueled by natural gas which made possible to reduce electricity consumption by more than 50%, increasing gas consumption only by 16,87% (per ton of product).
