

Environmental Product Declaration

In accordance with ISO 14025:2006 and EN 15804:2012+A2:2019/AC:2021 for:

Cooker Hood 1220-16, 1220-17, 1221-16, 1221-17, 1224-16, 1224-17, 1225-16, 1225-17

EPD of multiple products, based on a representative product
Valid for 24 product variants: white version, 50/60/70 cm

Franke Futurum AB

Programme:	The International EPD® System, www.environdec.com
Programme operator:	EPD International AB
EPD registration number:	EPD-IES-0015242
Date of publication:	2024-07-05
Date of validity:	2029-07-05

An EPD should provide current information and may be updated if conditions change. The stated validity is therefore subject to the continued registration and publication at www.environdec.com

General information

Programme information

Programme:	The International EPD® System
Address:	EPD International AB Box 210 60 SE-100 31 Stockholm Sweden
Website:	www.environdec.com
E-mail:	info@environdec.com

Accountabilities for PCR, LCA and independent, third-party verification

Product Category Rules (PCR)

CEN standard EN 15804 serves as the Core Product Category Rules (PCR)

Product Category Rules (PCR): Constructions products, PCR 2019:14, version 1.3.3 and Part B for ventilation components, NPCR 030:2021, version 1.1 (PCR Part B: c-PCR-018)

PCR review was conducted by:

The Technical Committee of the International EPD System. See www.environdec.com for a list of members. Review chair: Claudia A. Peña, University of Concepción, Chile. The review panel may be contacted via the Secretariat www.environdec.com/contact.

Life Cycle Assessment (LCA)

LCA accountability: Peter Ylmén, RISE Technical Research Institutes of Sweden, peter.ylmen@ri.se

Third-party verification

Independent third-party verification of the declaration and data, according to ISO 14025:2006, via:

EPD verification by individual verifier

Third-party verifier: Kristian Jelse, Greendesk AB, kristian@greendesk.se

Approved by: The International EPD® System

Procedure for follow-up of data during EPD validity involves third party verifier:

Yes No

The EPD owner has the sole ownership, liability, and responsibility for the EPD.

EPDs within the same product category but registered in different EPD programmes may not be comparable. For two EPDs to be comparable, they must be based on the same PCR (including the same version number up to the first two digits) or be based on fully-aligned PCRs or versions of PCRs; cover products with identical functions, technical performances and use (e.g. identical declared/functional units); have equivalent system boundaries and descriptions of data; apply equivalent data quality requirements, methods of data collection, and allocation methods; apply identical cut-off rules and impact assessment methods (including the same version of characterisation factors); have equivalent content declarations; and be valid at the time of comparison. For further information about comparability, see EN 15804 and ISO 14025.

Company information

Owner of the EPD: Franke Futurum AB

Contact: Joakim Lantto, joakim.lantto@franke.com

Description of the organisation: Provider of systems for domestic kitchens. The products covers complete solutions for food preparation and cooking, including sinks, taps, worktops, waste management systems, extractor hoods and cooking appliances, air purifiers and accessories.

Product-related or management system-related certifications: Franke is certified according to ISO 9001, ISO 14001 and ISO 45001 For the activities design, production, and servicing of electrical household and similar air –exhausting and purifying appliance and related accessories

Name and location of production site(s): Byske, Sweden

Product information

Product name: Cooker hood 1220-16, 1220-17, 1221-16, 1221-17, 1224-16, 1224-17, 1225-16, 1225-17

Product identification: By model number

Product description: The product is mounted above a stove to collect and exhaust the polluted air from cooking but also to provide light for when cooking. The hood will be connected to a ventilation system where a ventilation unit, including a fan, can be placed in connection to the cooker hood or centralized in a building. The ventilation unit is not included in the product. It is therefore categorised as the subcategory range hoods for residential use without fan as described in EN 13141-3.

UN CPC code: 448

Geographical scope: Some materials and parts are acquired globally in A1-A2 while manufacturing, use and end-of-life (A3-A5, B and C) are placed in Sweden.

Information related on EPDs of multiple products

The EPD is applicable for different model configurations with minor differences. The included models are 1220-16, 1220-17, 1221-16, 1221-17, 1224-16, 1224-17, 1225-16, 1225-17 in white, sizes 50, 60 and 70 cm. The representative product was chosen as 1225-17 60 cm, since 1225-17 has highest emissions in the group. The differences between the products are that they have different additions, such as transformers, damper materials, and electronics.

LCA information

Functional unit / declared unit: One cooker hood. Conversion unit to mass is 0.125.

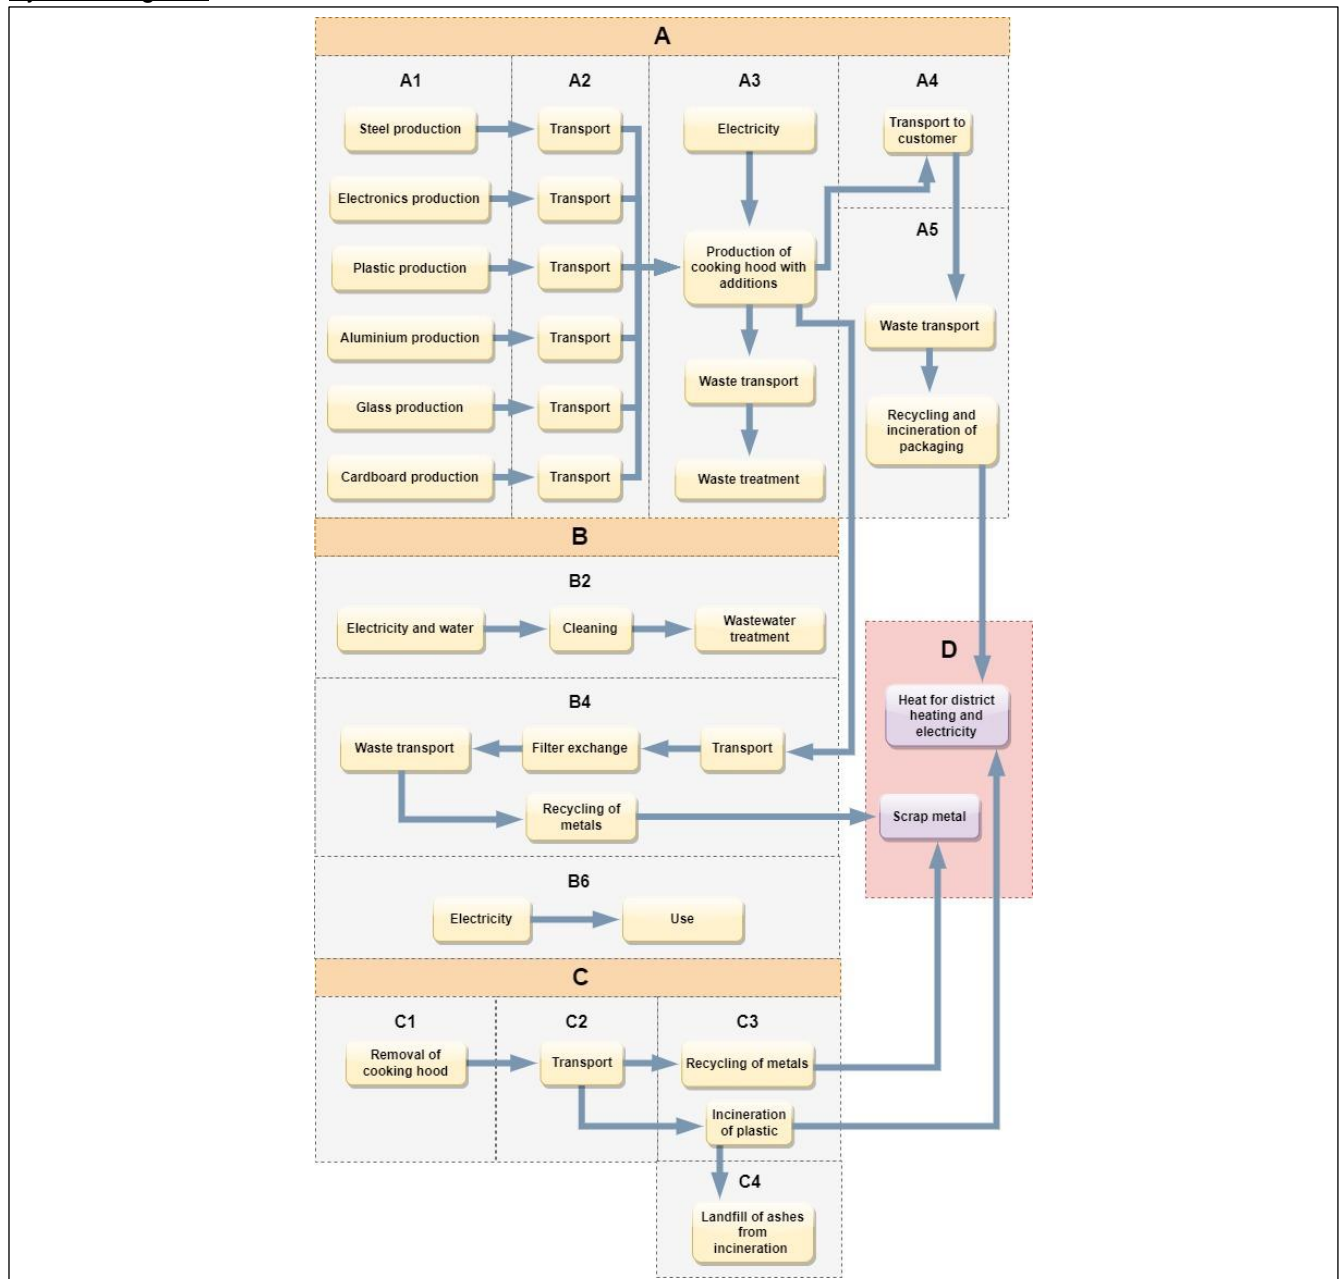

Reference service life: 25 years. The service life was established based on interviews customers that own multi-family houses combined with reliability calculations of critical components in specialized software.

Time representativeness: 2022

Database(s) and LCA software used: openLCA 2.0 with ecoinvent 3.9.1

Description of system boundaries: Cradle to grave and module D (A + B + C + D).

System diagram:

More information:

This EPD follows additional requirements for construction products considered as Electronic or Electric Equipment

A1–A3: Final processing and assembly of the product are made in the factory at Byske. The components and materials firstly arrive to the storage facility at the factory site. From there they are transported by forklift to their intended places for processing. All forklifts used in the production are run on electrical batteries. The electricity mix used in the factory was modelled as the providers residual electricity mix. The composition is 76.72% hydropower, 20.44% wind power, and 2.83% biobased power with the GWP-GHG value 0.011 kg CO₂-equivalents per kWh.

The steel sheets for the chassis are moved to a bending machine where they are punched out and transported by conveyor belt to be bent into shape. The sheets for illuminations are punched out in a four column hydraulic press and moved to a robot that bends them to the correct shape. Remaining steel parts are punched out and bent in the four-column hydraulic press.

The bent steel parts are then sent to a paint station. At the station the parts are hanged with hooks on a conveyor line. First the parts travel through a washer to remove oil and other contaminants. The parts are then dried in a dryer before going into a paint box where they are powder coated. In the final step they are transported through a furnace to melt and harden the paint. When the parts have cooled, they are taken down and moved by forklift to assembly.

The assembly consists of two steps. Preassembly where some parts are put together, packed, and then transported to the final assembly. At the final assembly all prepared parts are put together at seven stations for which material supplier provides the parts by forklift. The final product is then inspected and packed. The product is transported to storage before delivery to the customer. Spillage are sorted and collected for treatment.

Cut-off: There are very low amounts of polyoxymethylene and polyvinyl chloride, below 0.01% mass, in the dampers. In the manufacturing process there are three washing agents used in the washing process that are also not included due to the very low amount used per product. It is evident that the environmental impact from these substances is well below 1% compared to the product.

There are no measurements of the direct emissions from the powder coating process. By calculating impact from the direct emission in the ecoinvent dataset powder coating, steel (Europe), the resulting impact was negligible compared to the total impact in A3.

Allocation procedure: Flows that reach the end-of-waste state in modules A1-A3 were allocated as co-products in line with PCR 2019:14. The economic value of the product is assumed to be significantly higher than the spillage in the production line. As a conservative assumption, the allocations made in the calculations have been made based on economic value with all environmental impact allocated to the product. The economic difference between the different base units is low, $\pm 10\%$, and related to difference in material amount used. The resources used at the Franke production facility is not related to cost nor size, therefore they were split evenly for all the produced units.

Documentation of scenario settings

A4: The transports of the assembled products are made by lorry and the average transport distance was calculated to 1002 km. The type of transport is lorry class EURO6 with 0.44 litre diesel per kilometre. The assumed loading factor is 70% with a bulk density of 396 kg/m³

A5: The cardboard for packaging has 78% recycling rate and the remaining 22% are incinerated together with the plastics and wood with heat recovery. The product is assumed to be manually mounted. Any energy used for power tools is considered negligible and therefore disregarded.

B1: There are no resources needed to use the product except the energy accounted for in B6.

B2: The filters are to be cleaned twice a month in a dishwasher and the hood wiped twice a year. This was estimated to represent three full dish machines cycles a year with the electricity and water consumption as 2.67 kWh and 31.29 litre respectively. The simulated electricity mix is Swedish market average from the ecoinvent database.

B3: If the product is maintained properly no repairs are expected to occur during the products service life.

B4: The filters in the base units are assumed to be replaced twice during the product service life as a conservative estimate. The energy used to produce the filters were calculated as 0.07 kWh/filter. The materials for manufacturing a filters is 0.31 kg aluminium. The simulated electricity mix is Swedish market average from the ecoinvent database.

B5: No refurbishment is expected.

B6: The expected energy consumption is 5.6 kWh/year. The simulated electricity mix is Swedish market average from the ecoinvent database.

B7: The product has no operational water use.

C1: The product is assumed to be manually dismantled and sorted as household appliances. Any energy used for power tools is considered negligible and therefore disregarded.

C2: The product is transported 50 km to the nearest waste management facility. In the same way as in A4.

C3: The waste is managed according to the default scenario in NPCR 030:2021. Central sorting of the materials in the product. The plastic is incinerated with heat recovery and the metals are recycled. The electronic parts are recycled with incineration of non-recycled parts.

C4: Landfilling of ashes from incineration and glass.

D: The recycled metals in the module B4 and C3 replace scrap metal to be used for other products and was calculated as negative emissions in module D. The amount of recycled cardboard was not included in module D as a conservative assumption based on the low amount.

The heat and electricity generated from waste incineration in A5 and C3 was assumed to replace district heating and the average electricity mix in Sweden

The generic data for energy, transports and waste management include infrastructure and capital goods. In the datasets for raw materials these are not included. The allocation model for the data from ecoinvent is allocation, cut-off, EN15804, which complies with PCR 2019:14. Characterization factors based on EF 3.1 has been used.

Modules declared, geographical scope, share of specific data (in GWP-GHG results) and data variation (in GWP-GHG results):

	Product stage			Construction process stage		Use stage							End of life stage				Resource recovery stage

TOTAL	1.83 (1.83–1.91)	23	0.75

Dangerous substances from the candidate list of SVHC for Authorisation is below 0.1% in the product.

Environmental performance

Mandatory impact category indicators according to EN 15804

Disclaimer: The results of modules A1-A3 should not be used without considering the results of module C.

The estimated impact results are only relative statements, which do not indicate the endpoints of the impact categories, exceeding threshold values, safety margins and/or risks.

The products included in the EPD have not above +10% of the reported results.

Acronyms	PM = Potential incidence of disease due to particular matter emissions; IRP = Ionizing radiation, human health; ETP-fw = Eco-toxicity (freshwater); HTP-c = Human toxicity, cancer effects; HTP-nc = Human toxicity, non-cancer effects; SQP = Land use related impacts/Soil quality.															

* This impact category deals mainly with the eventual impact of low dose ionizing radiation on human health of the nuclear fuel cycle. It does not consider effects due to possible nuclear accidents, occupational exposure nor due to radioactive waste disposal in underground facilities. Potential ionizing radiation from the soil, from radon and from some construction materials is also not measured by this indicator

**Disclaimer: The results of this environmental impact indicator shall be used with care as the uncertainties of these results are high or as there is limited experience with the indicator.

The results of the impact categories abiotic depletion of minerals and metals, land use, human toxicity (cancer), human toxicity, non-cancer and ecotoxicity (freshwater) may be highly uncertain in LCAs that include capital goods/infrastructure in generic datasets, in case infrastructure/capital goods contribute greatly to the total results. This is because the LCI data of infrastructure/capital goods used to quantify these indicators in currently available generic datasets

¹ This indicator accounts for all greenhouse gases except biogenic carbon dioxide uptake and emissions and biogenic carbon stored in the product. As such, the indicator is identical to GWP-total except that the CF for biogenic CO₂ is set to zero.

sometimes lack temporal, technological and geographical representativeness. Caution should be exercised when using the results of these indicators for decision-making purposes.

Acronyms	PERE = Use of renewable primary energy excluding renewable primary energy resources used as raw materials; PERM = Use of renewable primary energy resources used as raw materials; PERT = Total use of renewable primary energy resources; PENRE = Use of non-renewable primary energy excluding non-renewable primary energy resources used as raw materials; PENRM = Use of non-renewable primary energy resources used as raw materials; PENRT = Total use of non-renewable primary energy re-sources; SM = Use of secondary material; RSF = Use of renewable secondary fuels; NRSF = Use of non-renewable secondary fuels; FW = Use of net fresh water															

The energy used as raw material is declared as an input to the module where it enters the product system (in module A1-A3) and as an equally large output from the product system where it exits the product system (i.e., module A5 for packaging content and module C3 for product content) for use in another product system or as waste (option A in PCR 2019:14).
